1.0 EXECUTIVE SUMMARY

This Traffic Impact Report builds upon, and supersedes, the Traffic Impact Study dated March 8, 2024 prepared by Creighton Manning (CM). The purpose of this report is to evaluate the potential traffic impacts associated with the proposed Winston Farm Planned Development District located at the northwest quadrant of the intersection of NYS Route 32 and NYS Route 212 in the Town of Saugerties, New York. Within this report, the operating characteristics of the proposed access points and impacts to the adjacent roadway network are identified. Mitigating measures, if needed, are provided to minimize capacity or safety concerns. To define traffic impact, this analysis establishes existing baseline traffic conditions, projects background traffic flow including area growth, and determines the traffic operations that would result from the proposed project. The site plan, all figures, and supporting calculations are included at the end of this report.

This comprehensive Traffic Impact Report provides the Town of Saugerties, the NYSDOT, and other involved and interested agencies with detailed information allowing for a "hard look" of potential traffic impacts. The study was completed in accordance with the procedures of the SEQRA, the NYSDOT, ITE, and local requirements. This study's scope was derived from Section 4.6.8 "Impacts on Transportation" of the Draft Generic Environmental Impact Statement (DGEIS) Final Scope issued on January 4, 2023.

Project Location and Description

Saugerties Farm LLC is proposing to rezone ±840 acres of predominately vacant land in the General Business (GB) and Moderate Density Residential (MDR) districts to a Planned Development district (PDD). To assess any potential adverse traffic impacts due to the proposed project, three alternatives are being considered: (1) Current Zoning or as-of-right plan (AOR), (2) Sponsor's Preferred plan (SP), and (3) the Reasonable Worst-Case Scenario (RWCS).

The project site is located at the northwest quadrant of the intersection of NYS Route 32 and NYS Route 212 within the Town of Saugerties, Ulster County, NY. The following describes the project location and context:

- **Site Status:** The site is currently undeveloped.
- **Site Boundary:**
  - **North:** Residential development/Mower Mill Rd and other undeveloped land.
  - **East:** NY-32, Holiday Inn Express and Saugerties Park & Ride.
  - **South:** Commercial and residential uses and NY-212.
  - **West:** Undeveloped land.
- **Vicinity Land Uses:** There is a mix of land uses, including residential, hospitality, and commercial.

Saugerties Farm LLC is proposing to rezone ±840 acres of predominately vacant land in the General Business (GB) and Moderate Density Residential (MDR) districts to a Planned Development district (PDD). To assess any potential adverse traffic impacts due to the proposed project, three alternatives are being considered: (1) Current Zoning or as-of-right plan (AOR), (2) Sponsor's Preferred plan (SP), and (3) the Reasonable Worst-Case Scenario (RWCS).

The AOR is comprised of the following components based on the current property zoning:

- **Single Family Housing:**
  - ±773 units on approximately 419 acres
- **Commercial Development Land Use(s) zoned general business:**
  - ±26 acres
- **Access:** Provided via two driveways on NY-32 and three driveways on NY-212.

The SP plan includes careful planning and consideration of where development should occur on the site based on a host of studies that have been commissioned by the landowners. These technical studies have been used to fine-tune the SP plan relative to the location of buildings, roads, and uses on the project site. The SP plan is comprised of the following components:

- **Residential:**
  - ±154 single family home units
  - ±110 townhouses
  - ±650 condo/apartment units
- **Commercial Development:**
  - ±419,800 square feet of commercial retail space
  - a campground with 100 cabins
  - a 150-room boutique hotel
  - a conference center with 250 hotel rooms
  - a 5,000-person amphitheater
  - ±250,000 square feet of lab or light- industrial space
- **Access:** Provided via two driveways on NY-32 and two driveways on NY-212.

The RWCS was created to show a reasonable maximum development scenario under the new proposed zoning regulations, which includes less residential homes but larger commercial and tech industrial spaces compared to the SP Plan. The RWCS plan includes the following components:

- **Residential:**
  - ±133 single family home units
  - ±115 townhouses
  - ±800 condo/apartment units
- **Commercial Development:**
  - ±425,000 square feet of commercial retail space
  - a campground with 157 cabins and RV sites
  - a 150-room boutique hotel
  - a conference center with 250 hotel rooms
  - a 5,000-person amphitheater
  - ±375,000 square feet of lab or light- industrial space
- **Access:** Provided via two driveways on NY-32 and one driveway on NY-212.

Study Area

This study's scope was derived from Section 4.6.8 "Impacts on Transportation" of the Draft Generic Environmental Impact Statement (DGEIS) Final Scope issued on January 4, 2023. To ensure a comprehensive analysis of potential traffic impacts, a study area was selected consisting of the following intersections. **Figures 1A through 1H** illustrate the study area and project location.

1. NYS Route 212/Blue Mountain Road
2. NYS Route 212/Churchland Road
3. NYS Route 212/NYS Route 32
4. NYS Route 212/Churchland Lane
5. NYS Route 212/unsignalized driveways (8 intersections between I-87 overpass and Big Lots Driveway)
6. NYS Route 212/I-87 Northbound Ramps
7. NYS Route 212/Kings Highway
8. NYS Route 212/Big Lots Driveway

9. NYS Route 212/Railroad Avenue
10. NYS Route 212/Market Street
11. Main Street/Market Street/James Street
12. Main Street/Partition Street
13. NYS Route 32/I-87 Southbound Ramps/Augusta Savage Road
14. NYS Route 32/Old Route 32
15. NYS Route 32/Mower Mill Road
16. NYS Route 32/Peoples Road/Hommelville Road
17. NYS Route 32/Old Kings Highway
18. NYS Route 32/Malden Turnpike/Old Route 32
19. Harry Wells Road/Buffalo Road

Existing and Background Conditions

According to the March 8, 2024 CM TIS, "Turning movement counts were conducted during the weekday morning (7:00 AM – 9:00 AM), weekday afternoon/evening (2:00 PM – 7:00 PM), Friday afternoon/evening (3:00 PM – 8:00 PM), Saturday midday/afternoon (11:00 AM - 5:00 PM), and Sunday midday/afternoon (11:00 AM - 5:00 PM) peak periods. In order to capture typical school traffic and seasonal ski traffic, the counts were conducted during the winter season in December 2022 and January 2023. The counts were conducted when schools were in normal session and did not follow or precede any holidays. The counts captured the breakdown in vehicle classifications (lights, buses, heavy vehicles) as well as bicycles and pedestrians. These periods coincide with the anticipated peak operation times of the proposed development as well as the adjacent street traffic." The general peak hours occurred from 7:30-8:30 AM for the weekday morning peak hour, 3:30-4:30 PM for the weekday afternoon/evening peak hour, 4:30-5:30 PM for the Friday afternoon/evening peak hour, 11:15 AM-12:15 PM for the Saturday midday/afternoon peak hour, and 11:45 AM-12:45 PM for the Sunday midday/afternoon peak hour.

Additionally, and in accordance with the DGEIS Scoping Document, a series of Automatic Traffic Recorders (ATRs) were installed to collect traffic volume, speed, and classification data over several days in December 2022 and January/February 2023. These ATRs were placed on the following roadways:

1. NYS Route 212 | 187 feet East of Blue Mountain Road
2. NYS Route 212 | 390 feet West of NYS Route 32
3. NYS Route 212 | 249 feet East of Churchland Lane
4. NYS Route 212 | 315 feet West of Kings Highway
5. Kings Highway | 700 feet South of NYS Route 212
6. Railroad Avenue | 445 feet South of NYS Route 212
7. NYS Route 32 | 500 feet South of I-87 Southbound Ramps/Augusta Savage Road
8. NYS Route 32 | 190 feet North of I-87 Southbound Ramps/Augusta Savage Road
9. NYS Route 32 | 350 feet South of Mower Mill Road

The turning movement count data was collected while local schools were in session. Calibration factors were calculated by comparing the historic traffic volumes to the recent ATR volumes and then applied to the observed peak hour volumes in order to generate volumes that represent pre-COVID traffic conditions. The findings of the traffic volume comparisons as well as the calibration factors were presented to and validated by the Town's Traffic Consultant, Philip Grealy of Colliers Engineering & Design. The actual differences in traffic volumes can be attributed to temporal variations in traffic volumes as well as activity related to driveways located in the segments between the study intersections.

Background traffic volumes represent the traffic conditions during the proposed build year without development of the project. It is assumed that the development could be completed and occupied in 2028. In accordance with the DEIS

Scoping Document, the analysis should be conducted for the estimated year of project completion (design year) plus 10 years. In keeping with NYSDOT standards, the design year was rounded to 2030 and prepared traffic projections for 10 years beyond the estimated time of completion (ETC+10) – 2040. Traffic volume data from various ATRs published on the NYSDOT *Traffic Data Viewer* were reviewed and an annual growth rate of +0.50% was calculated. This growth rate, upon review and approval by the Town's Traffic Consultant, Philip Grealy, was applied to the 2023 existing calibrated volumes and compounded annually for 17 years. Traffic related to specific developments were also added to the background/no-build conditions. The widely accepted methodology for preparing traffic impact studies requires that any projects in the study area that are currently approved and/or under construction must be considered in the traffic analysis. Projects that are contemplated but not yet approved are not typically included in a traffic analysis. Two nearby developments were identified by the Town's Planning Board Secretary and were included in the background (No-Build) conditions.

Traffic Analyses

A crash investigation within the study area was conducted to assess the safety history from October 1, 2019, through September 30, 2024. 12 of the 26 study intersections had a crash rate equal to or higher than the statewide averages. As discussed in Section 7.2 and 7.4, a traffic signal is warranted and recommended at the NYS Route 32/Hommelville Rd/Peoples Rd and NYS Route 32/Old Kings Hwy intersections. The left turn crash clusters at the NYS Route 32/Hommelville Rd/Peoples Rd and NYS Route 32/Old Kings Hwy intersections can be mitigated through the installation of a traffic signal with a flashing yellow arrow for the permitted left turn phases. Additionally, in order to mitigate the existing left turn crash pattern in the eastbound direction at the NYS Route 212/NYS Route 32, it is recommended that NYSDOT considers installing flashing yellow arrows for the permitted left turn phases for at least the eastbound approach. The remaining intersections with above average collision rates should be explored in conjunction with the associated jurisdictional agency to determine applicable mitigation.

The volume of traffic generated by a site is dependent on the intended land use and size of the development. Trip generation is an estimate of the number of trips generated by a specific building or land use. These trips represent the volume of traffic entering and exiting the development. *Trip Generation Manual (11th Edition)* published by the Institute of Transportation Engineers (ITE) is used as a reference for this information. The trip rate for the peak hour of the generator may or may not coincide in time or volume with the trip rate for the peak hour of adjacent street traffic. Volumes generated during the peak hour of the adjacent street traffic and proposed land uses represent a more critical volume when analyzing the capacity of the system; those intervals will provide the basis of this analysis.

The AOR scenario is expected to generate approximately 327 entering/494 exiting vehicle trips during the AM peak hour, 592 entering/431 exiting vehicle trips during the PM peak hour, 671 entering/450 exiting vehicle trips during the Friday peak hour, 668 entering/714 exiting vehicle trips during the Saturday peak hour, and 521 entering/495 exiting vehicle trips during the Sunday peak hour. The SP scenario is expected to generate approximately 645 entering/583 exiting vehicle trips during the AM peak hour, 810 entering/781 exiting vehicle trips during the PM peak hour, 926 entering/856 exiting vehicle trips during the Friday peak hour, 933 entering/856 exiting vehicle trips during the Saturday peak hour, and 681 entering/706 exiting vehicle trips during the Sunday peak hour. The RWCS scenario is expected to generate approximately 754 entering/642 exiting vehicle trips during the AM peak hour, 873 entering/853 exiting vehicle trips during the PM peak hour, 952 entering/881 exiting vehicle trips during the Friday peak hour, 999 entering/915 exiting vehicle trips during the Saturday peak hour, and 775 entering/803 exiting vehicle trips during the Sunday peak hour.

The cumulative effect of site generated traffic on the transportation network is dependent on the origins and destinations of that traffic and the location of the access drives serving the site. Trip distribution patterns determined in the March 8, 2024 CM TIS were used for this analysis. Traffic generated by the project was distributed throughout the

adjacent roadway system based on potential travel patterns and places of interest for the future users of the project. It should be noted that the same general trip distributions were used for the SP and RWCS analyses. For the AOR analysis, the overall regional distribution was maintained; however, the local distributions at the study intersections were modified to account for differences in the access driveway location.

This study used the Transportation Research Board's (TRB) *NCHRP Report 279 Intersection Channelization Design Guide* to evaluate the volume warrants for a left-turn treatment at the NY-212/Proposed Easterly Driveway, NY-212/Proposed Westerly Driveway, and NY-32/Proposed Driveway intersections under the Sponsor's Preferred full build conditions. The analyses determined that a left-turn treatment is warranted at both the NY-212/Proposed Easterly Driveway and NY-32/Proposed Driveway intersections. A left turn treatment is not warranted at the NY-212/Proposed Westerly Driveway intersection.

A traffic signal warrant analysis was performed at the existing NY-32/Peoples Rd/Hommelville Rd and NY-32/Old Kings Hwy intersections under existing, background, and the Sponsor's Preferred full build conditions and at the NY-212/Proposed Easterly Driveway and NY-32/Proposed Driveway intersections under the Sponsor's Preferred full build conditions. Based upon the results, a traffic signal is warranted at all four intersections under full build conditions. In order to determine the optimal mitigation for these intersections, the installation of a traffic signal and a roundabout were considered at these locations. The roundabout evaluation indicates that all intersections are likely to operate sufficiently as either a single-lane or double-lane roundabout depending on the intersection ADT. It should be noted that the geometric feasibility, i.e. the constructability of a roundabout, was not investigated at this time. For the purposes of this study, detailed operational analyses of these intersections were not conducted. Rather, capacity improvements and/or phasing and timing changes were explored to mitigate operational constraints expected under the 2040 Sponsors Preferred Build conditions.

The capacity and queueing analyses reveal that off-site locations are expected to experience operational constraints due to the additional volumes from full build-out in the PDD. Possible improvements have been identified that, if implemented, will improve the operations at these locations. Table 12 in Section 7.8 of this report provides a summary of the locations with these constraints and the possible improvements. If approved, these improvements would be implemented by the applicant in coordination with the Town of Saugerties, Ulster County, and NYSDOT and would be funded based on the respective jurisdictional agency's preferred method. Conceptual improvement plans would be prepared subsequent to preliminary approval by the respective jurisdictional agencies.

Conclusions and Recommendations

This report identified and evaluated the potential traffic impacts that can be expected from the proposed rezoning of the Winston Farm development. The scope of this study was based on Section 4.6.8 "Impacts on Transportation" of the Final Scope DGEIS, dated January 4, 2023 and includes 26 off-site intersections. Traffic volume data was collected in December 2022 and January 2023 in order to capture peak ski season traffic and the study conservatively evaluated a design year of 2040. The study evaluated three development scenarios – As-of-Right (AOR), Sponsor's Preferred (SP), and Reasonable Worst Case Scenario (RWCS). The results of this comprehensive study determined that the existing transportation network can adequately accommodate the projected traffic volumes and resulting minor traffic impacts to study area intersections with the recommended mitigation in place. The following sets forth the conclusions and recommendations based upon the results of the analyses:

Conclusions

1. The crash analysis indicates that nine (9) of the twenty-six (26) intersections evaluated experienced crash rates greater than the state-wide average for similar types of intersections. The crash analysis generally did not identify any geometric deficiencies at any of the intersections.
2. All site driveways will be signalized thereby eliminating most sight distance concerns. As each phase of the project goes through the site planning process and updated traffic studies are provided, they should look closely at the access points at that time to determine if right turn on red movements should be prohibited due to sight distance concerns.
3. At this preliminary phase of the project, the exact number and layout of parking areas has not been determined. However, upon review of the plans it is evident that ample parking areas are strategically provided throughout the site area to serve the individual land uses on-site.
4. Under the AOR scenario, the project would generate the fewest amount of peak hour trips. Under the SP scenario, the project would generate more trips than under AOR scenario during each of the study peak hours with the lowest difference being 371 total trips and the greatest difference being 662 total trips. Finally, under the RWCS scenario, the project would generate more trips than under both the AOR and SP scenarios during each of the study peak hours.
5. The AOR scenario is expected to generate approximately 327 entering/494 exiting vehicle trips during the AM peak hour, 592 entering/431 exiting vehicle trips during the PM peak hour, 671 entering/450 exiting vehicle trips during the Friday peak hour, 668 entering/714 exiting vehicle trips during the Saturday peak hour, and 521 entering/495 exiting vehicle trips during the Sunday peak hour.
6. The SP scenario is expected to generate approximately 645 entering/583 exiting vehicle trips during the AM peak hour, 810 entering/781 exiting vehicle trips during the PM peak hour, 926 entering/856 exiting vehicle trips during the Friday peak hour, 933 entering/856 exiting vehicle trips during the Saturday peak hour, and 681 entering/706 exiting vehicle trips during the Sunday peak hour.
7. The RWCS scenario is expected to generate approximately 754 entering/642 exiting vehicle trips during the AM peak hour, 873 entering/853 exiting vehicle trips during the PM peak hour, 952 entering/881 exiting vehicle trips during the Friday peak hour, 999 entering/915 exiting vehicle trips during the Saturday peak hour, and 775 entering/803 exiting vehicle trips during the Sunday peak hour.
8. The left turn lane warrant investigation indicates that a left-turn treatment is warranted at the NYS Route 212/proposed easterly driveway and at the NYS Route 32/Proposed driveway intersections during all peak hours under full development conditions. A left-turn treatment is not warranted at the NYS Route 212/proposed westerly driveway.
9. Based upon the results of the traffic signal warrant analysis, a traffic signal is warranted at all four intersections evaluated under full build conditions. These locations include: the existing NY-32/Peoples Rd/Hommelville Rd and NY-32/Old Kings Hwy intersections and the NYS Route 212/Proposed Easterly Driveway and NYS Route 32/Proposed Driveway intersections.
10. The intersections that meet signal warrants were also evaluated for feasibility of installing a roundabout. All intersections are likely to operate sufficiently as either a single-lane or double-lane roundabout depending on the intersection ADT. It should be noted that the geometric feasibility, i.e. the constructability of a roundabout, was not investigated at this time. For the purposes of this study, detailed operational analyses of these intersections were not conducted. Rather, capacity improvements and/or phasing and timing changes were explored to mitigate operational constraints expected under the 2040 Sponsors Preferred Build conditions. A

more detailed evaluation should be conducted as traffic studies are updated during the site plan approval processes in the future.

11. A feasibility evaluation for roundabouts was performed at the following intersections: NYS Route 32/Old kings Hwy, NYS Route 32/Peoples Road, NYS Route 32/Northeast Area Driveway, NYS Route 32/Augusta Savage Road/Interstate-87 SB Ramp, NYS Route 32/NYS Route 212, and NYS Route 212/South Area Driveway. all intersections are likely to operate sufficiently as either a single-lane or double-lane roundabout depending on the intersection ADT.
12. Most of the study intersections are expected to operate at acceptable operating conditions that are similar to the background (No-build) conditions with the recommended mitigation in place. Section 7.6 provides details related to the operating conditions at each intersection.
13. A queuing assessment was performed at each signalized intersection during all peak hours under existing, background, SP full build, and SP full build with mitigation conditions to determine the 95th percentile queue length, measured from the stop bar location for each approach using Synchro. In general, 95th percentile queues so not exceed available storage with the recommended mitigation measures in place with minor exceptions that are discussed in more detail in Section 7.7.
14. The proposed project intends to embrace the goals of Ulster County Transportation Improvement Program. Furthermore, it is prepared to work with UCAT as well as the Greyhound and Trailways bus services to expand services to better support the traveling public.
15. Pursuant to the State Environmental Quality Review Act, this detailed analysis demonstrates that the proposed project does not result in any significant adverse traffic impacts.

Recommendations

1. Based on the crash evaluation, it is recommended that NYSDOT considers installing flashing yellow arrows for the permitted left turn phases for at least the eastbound approach at the NYS Route 212/NYS Route 32 intersection to mitigate the left turn crash pattern.
2. As the proposed development moves through the future site plan review process, detailed design related to the number of parking spaces, appropriate on and off-site wayfinding, and the need for temporary event traffic control should be evaluated.
3. A more detailed roundabout evaluation should be conducted as traffic studies are updated during the site plan approval processes in the future.
4. The detailed capacity analysis showed that the additional traffic volumes generated by the proposed project can be accommodated by the existing roadway network with the recommended mitigation in place.
5. Various mitigation measures were evaluated to address operational constraints resulting from the SP and RWCS development scenarios. These mitigation measures are discussed in detail in Sections 7.6 and 7.8 and can be found in Table 12 which is reproduced below. The mitigation measures include changes to intersection geometry, signalization of intersections, and adjustments to existing signal timings and phasing.

Off Site Mitigation Summary

Location	Build Conditions Concerns	Possible Improvements
NYS Route 32/NYS Route 212 Intersection	• Southbound delays • Overall intersection delays • Westbound and southbound queues	• Signal timing modifications • Southbound approach lane geometry changes
NYS Route 212/I-87 NB Ramp Intersection/ McDonalds Driveway	• Overall intersection delay • Eastbound delays • Queue on the corridor	• Construct northbound right lane • Extend second northbound lane to provide 450 ft of storage • Signal phasing/timing/coordination modifications
NYS Route 212 Signalized Intersections: 1. Kings Highway 2. Big Lots Driveway	• Overall intersection delay • Eastbound delays • Queue on the corridor	• Signal timing coordination
NYS Route 212/I-87 SB Ramp Intersection/ Augusta Savage Rd	• Overall intersection/approach delays • Queue on the approaches	• Construct additional approach lanes and/or revise lane geometry on all four approaches • Signal phasing/timing modifications
NYS Route 32/Hommelville Rd/Peoples Rd	• Delays on eastbound and westbound approaches	• Proposed traffic signal
NYS Route 32/Old Kings Highway (CR 34)	• Delays on westbound approach	• Install northbound right turn lane • Proposed traffic signal

2.0 INTRODUCTION

2.1 Study Purpose and Objectives

This Traffic Impact Report builds upon, and supersedes, the Traffic Impact Study dated March 8, 2024 prepared by Creighton Manning (CM). The purpose of this report is to evaluate the potential traffic impacts associated with the proposed Winston Farm Planned Development District located at the northwest quadrant of the intersection of NYS Route 32 and NYS Route 212 in the Town of Saugerties, New York. Within this report, the operating characteristics of the proposed access points and impacts to the adjacent roadway network are identified. Mitigating measures, if needed, are provided to minimize capacity or safety concerns. To define traffic impact, this analysis establishes existing baseline traffic conditions, projects background traffic flow including area growth, and determines the traffic operations that would result from the proposed project. The site plan, all figures, and supporting calculations are included at the end of this report.

2.2 Traffic Impact Report Methodology

This comprehensive Traffic Impact Report provides the Town of Saugerties, the NYSDOT, and other involved and interested agencies with detailed information allowing for a "hard look" of potential traffic impacts. The study was completed in accordance with the procedures of the SEQRA, the NYSDOT, ITE, and local requirements. This study's scope was derived from Section 4.6.8 "Impacts on Transportation" of the Draft Generic Environmental Impact Statement (DGEIS) Final Scope issued on January 4, 2023.

2.3 Project Location

The project site is located at the northwest quadrant of the intersection of NYS Route 32 and NYS Route 212 within the Town of Saugerties, Ulster County, NY. The following describes the project location and context:

- **Site Status:** The site is currently undeveloped.
- **Site Boundary:**
  - **North:** Residential development/Mower Mill Rd and other undeveloped land.
  - **East:** NY-32, Holiday Inn Express and Saugerties Park & Ride.
  - **South:** Commercial and residential uses and NY-212.
  - **West:** Undeveloped land.
- **Vicinity Land Uses:** There is a mix of land uses, including residential, hospitality, and commercial.

2.4 Study Area

This study's scope was derived from Section 4.6.8 "Impacts on Transportation" of the Draft Generic Environmental Impact Statement (DGEIS) Final Scope issued on January 4, 2023. To ensure a comprehensive analysis of potential traffic impacts, a study area was selected consisting of the following intersections. **Figures 1A through 1H** illustrate the study area and project location.

1. NYS Route 212/Blue Mountain Road
2. NYS Route 212/Churchland Road
3. NYS Route 212/NYS Route 32
4. NYS Route 212/Churchland Lane
5. NYS Route 212/unsignalized driveways (8 intersections between I-87 overpass and Big Lots Driveway)
6. NYS Route 212/I-87 Northbound Ramps
7. NYS Route 212/Kings Highway
8. NYS Route 212/Big Lots Driveway

9. NYS Route 212/Railroad Avenue
10. NYS Route 212/Market Street
11. Main Street/Market Street/James Street
12. Main Street/Partition Street
13. NYS Route 32/I-87 Southbound Ramps/Augusta Savage Road
14. NYS Route 32/Old Route 32
15. NYS Route 32/Mower Mill Road
16. NYS Route 32/Peoples Road/Hommelville Road
17. NYS Route 32/Old Kings Highway
18. NYS Route 32/Malden Turnpike/Old Route 32
19. Harry Wells Road/Buffalo Road

3.0 TRANSPORTATION SETTING

3.1 Description of Study Area Roadways

The information outlined in **Table 1** provides a description of the existing roadway network within the study area. **Figure 2** illustrates the lane geometry and traffic controls at each of the study intersections and the Annual Average Daily Traffic (AADT) volumes on the study roadways. The AADTs, in vehicles per day (vpd), reflect the most recently collected data obtained from the NYSDOT or Passero Associates (PA) via an extrapolation of turning movement counts performed at the study intersections.

Functional classification (FC) of roadways is determined by the NYSDOT and the Federal Highway Administration (FHWA). Both the NYSDOT and FHWA groups roads, streets, and highways into different classes based on how they are used. This is called functional classification. Roads and streets do not work alone to move traffic. Instead, they form a network. Functional classification defines how each road or street fits into this network, how it provides access to nearby properties, and whether it is in an urban or rural area. The following lists the primary functional classifications within the study area:

- Rural Minor Collector (Class 8)
- Rural Local (Class 9)
- Urban Principal Arterial – Interstate (Class 11)
- Urban Minor Arterial (Class 16)
- Urban Major Collector (Class 17)
- Urban Local (Class 19)

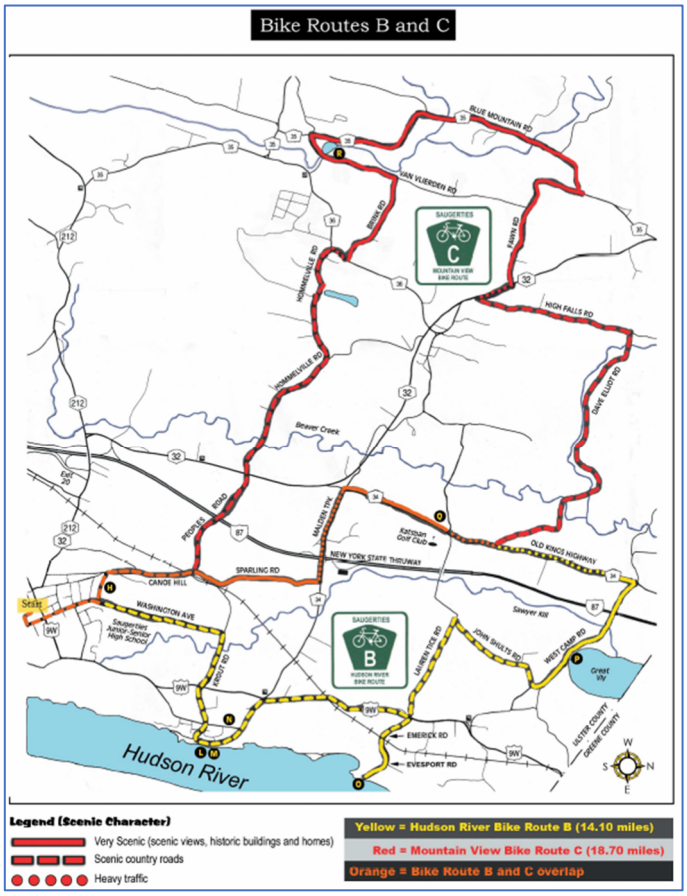
132	Golden Hill	-	-	-	-	600
	Mall area pickups must be communicated to dispatch by 900/1100/200/400					



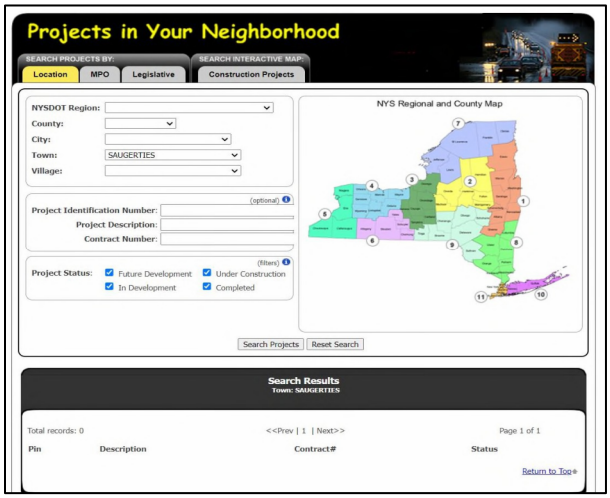
The available capacity of the UCAT bus route was estimated based on the total number of bus trips per day and a 35-person capacity per bus. The KS bus route operates 16 trips on weekdays and 5 trips on Saturday, which equates to an approximate 560-person and 175-person capacity on weekdays and Saturdays, respectively.

Additionally, there is an existing Park-and-Ride facility located along the NYS Route 32 site frontage. This facility provides 43 parking spaces and a sheltered bus stop that is served by Greyhound and Trailways express lines, which provide one (1) inbound and one (1) outbound bus trips per day including weekdays, Saturdays, and Sundays. The intent is to

maintain the same general location; however, it is expected that this facility will be relocated to accommodate the improvements at the NYS Route 32/Augusta Savage/I-87 SB Off-Ramp. **Table 3** summarizes the details of these express bus routes.

Table 3: *Summary of Available Transit Options in Study Area*

Route	Termini	Closest Stop to Site	Days of Operations	Headways (Weekday/Weekend)
Kingston Saugerties (KS) Route	Saugerties Post Office/ Golden Hill	Price Chopper – Ulster Ave	Weekdays & Saturdays	1 Hour/ 2 Hours
Greyhound/Trailways Express Lines	Oneonta / New York City	Park-and-Ride on Route 32	Weekday, Saturday & Sundays	Southbound towards NYC departs at 4:45pm Northbound towards Oneonta departs at 11:10am



There are no existing pedestrian accommodations along the subject site's frontages with NYS Route 212 and NYS Route 32, or within its general proximity. To the east of Interstate-87, a sidewalk is provided along the northerly side of NYS Route 212, and then along both sides of NYS Route 212 further east beyond Railroad Avenue. There is no dedicated bicycle trail/path within the site proximity; however, the Village of Saugerties defines a bicycle loop, known as "Bike Route B" that traverses Peoples Road and Hommelville Road which is approximately one mile north of the NYS Route 32 site frontage. See map illustrating "Bike Route B" to the left. Additionally, the majority of roadways surrounding the subject site provide shoulders that may be used by cyclists.

The Saugerties Central School District Transportation Department was contacted to request the school bus stop locations within the study area. No information has been received to date.

3.3 Planned/Programmed Highway Improvements

The NYSDOT *Projects in Your Neighborhood* web portal was reviewed and it was determined that there are no planned or ongoing projects within the study area. Additionally, the Ulster County Transportation Council FFY 2023- 2027 Transportation Improvement Program, adopted July 26, 2022, was reviewed and there are no planned projects within the study area.

4.0 EXISTING CONDITIONS ANALYSIS

4.1 Peak Intervals for Analysis

Given the functional characteristics of the corridors, adjacent land uses, the proposed land uses for the project site, and requirements of the approved Scoping Document, the peak hours selected for analysis are the weekday morning (AM), weekday afternoon/evening (PM), Friday afternoon/evening (FRI), Saturday midday/evening (SAT), and Sunday midday/evening (SUN) peak periods. The combination of site traffic and adjacent street traffic produces the greatest demand during these time periods. At all other times throughout a typical day, the site will generally produce less traffic.

4.2 Existing Traffic Volume Data

According to the March 8, 2024 CM TIS, "Turning movement counts were conducted during the weekday morning (7:00 AM – 9:00 AM), weekday afternoon/evening (2:00 PM – 7:00 PM), Friday afternoon/evening (3:00 PM – 8:00 PM), Saturday midday/afternoon (11:00 AM - 5:00 PM), and Sunday midday/afternoon (11:00 AM - 5:00 PM) peak periods. In order to capture typical school traffic and seasonal ski traffic, the counts were conducted during the winter season in December 2022 and January 2023. The counts were conducted when schools were in normal session and did not follow or precede any holidays. The counts captured the breakdown in vehicle classifications (lights, buses, heavy vehicles) as well as bicycles and pedestrians. These periods coincide with the anticipated peak operation times of the proposed development as well as the adjacent street traffic."

Table 4 depicts the study time periods and peak hours for analysis at each study intersection. The general peak hours occurred from 7:30-8:30 AM for the weekday morning peak hour, 3:30-4:30 PM for the weekday afternoon/evening peak hour, 4:30-5:30 PM for the Friday afternoon/evening peak hour, 11:15 AM-12:15 PM for the Saturday midday/afternoon peak hour, and 11:45 AM-12:45 PM for the Sunday midday/afternoon peak hour. Peak hours that deviate from the overall study area peak hour have traffic volumes that are greater during that time period than during the study area peak hour. This was done to ensure that any high volume movements that occur outside of the general peak hour were captured in the analysis.

Table 4: *Existing Traffic Volume Data Collection*

NYS Route 32/Old Route 32	Sunday, January 29th, 2023	11:45 AM-12:45 PM
NYS Route 32/Mower Mill Road	Sunday, January 29th, 2023	11:45 AM-12:45 PM
NYS Route 32/Peoples Road/Hommelville Road	Sunday, January 29th, 2023	11:45 AM-12:45 PM
NYS Route 32/Old Kings Highway	Sunday, January 29th, 2023	11:45 AM-12:45 PM
NYS Route 32/Malden Turnpike/Old Route 32	Sunday, January 29th, 2023	11:45 AM-12:45 PM
Harry Wells Road/Buffalo Road	Sunday, January 29th, 2023	2:00-3:00 PM

Additionally, and in accordance with the DGEIS Scoping Document, a series of Automatic Traffic Recorders (ATRs) were installed to collect traffic volume, speed, and classification data over several days in December 2022 and January/February 2023. These ATRs were placed on the following roadways:

1. NYS Route 212 | 187 feet East of Blue Mountain Road
2. NYS Route 212 | 390 feet West of NYS Route 32
3. NYS Route 212 | 249 feet East of Churchland Lane
4. NYS Route 212 | 315 feet West of Kings Highway
5. Kings Highway | 700 feet South of NYS Route 212
6. Railroad Avenue | 445 feet South of NYS Route 212
7. NYS Route 32 | 500 feet South of I-87 Southbound Ramps/Augusta Savage Road
8. NYS Route 32 | 190 feet North of I-87 Southbound Ramps/Augusta Savage Road
9. NYS Route 32 | 350 feet South of Mower Mill Road

This data is also included on Figure 2.

As noted above, the turning movement count data was collected while local schools were in session. CM compared the observed volumes from each study period to historical data collected by various NYSDOT Automatic Traffic Recorders (ATRs), Stations 860027, 860054, 866009, 860055, 860254, between 2017 and 2019, as well as old ATR data previously collected by CM in 2014 and 2019. CM found that the general traffic volumes were lower in previous years for the weekday morning, Friday, and Saturday midday hours, and higher for the weekday evening and Sunday midday hours. Calibration factors were calculated by comparing the historic traffic volumes to the recent ATR volumes and then applied to the observed peak hour volumes in order to generate volumes that represent pre-COVID traffic conditions.[1] The findings of the traffic volume comparisons as well as the calibration factors were presented to and validated by the Town's Traffic Consultant, Philip Grealy of Colliers Engineering & Design. The actual differences in traffic volumes can be attributed to temporal variations in traffic volumes as well as activity related to driveways located in the segments between the study intersections. **Figures 3A-3C** illustrate the existing peak hour traffic volumes for each study peak.

4.3 Field Observations

The study intersections were observed during peak intervals to assess current traffic operations. Signal timing and phasing information was obtained from the NYSDOT to determine peak hour phasing plans and phase durations during each interval at the signalized intersections. This information was used to support and/or calibrate capacity analysis models described in detail later in this report.

4.4 Existing Crash Investigation

The purpose of this crash analysis is to identify inherent safety issues by studying and quantifying historical crashes at the study intersections and identifying potential crash patterns and clusters. A crash cluster is defined as an abnormal occurrence of similar crash types occurring at approximately the same location or involving the same geometric features. The severity of the crashes should also be considered. A history of crashes is an indication that further analysis is required to determine the cause(s) of the crash(es) and to identify what actions, if any, could be taken to mitigate the crashes.

A crash investigation within the study area was conducted to assess the safety history from October 1, 2019, through September 30, 2024.

[1] Weekday AM Calibration Factor = 1.00 | Weekday PM Calibration Factor = 1.04 | Friday PM Calibration Factor = 1.00 | Saturday Midday Calibration Factor = 1.00 | Sunday Midday Calibration Factor = 1.02

Reportable (non-injury, injury, and fatal injury) type crashes are defined as damage to one person's property in the amount of $1,001 or more. The Non-Reportable type crashes result in property damage of $1,000 or less. Crash rates were computed for the study intersections and compared with NYSDOT average crash rates for similar intersections, as summarized in **Table 5**. Intersection rates are listed as crashes per million entering vehicle (CR/MEV).

Table 5: *Intersection Crash Rate Analysis*

INTERSECTION	NUMBER OF CRASHES	NUMBER OF ENTERING VEHICLES	ACTUAL CRASH RATE	STATEWIDE AVERAGE CRASH RATE
NYS Route 212/Blue Mountain Road	10	7,011 vpd	0.78	0.19
NYS Route 212/Churchland Road	0	7,632 vpd	0.00	0.19

NYS Route 32/Malden Turnpike/Old Route 32	0	11,495 vpd	0.00	0.31
Harry Wells Road/Buffalo Road	0	1,568 vpd	0.00	0.19

Notable crash clusters are approaches with three or greater identifiable consistent crash types.

1. NYS Route 212 at Blue Mountain Road

As shown in **Table 5**, the intersection has a crash rate that is approximately 4.11 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (1), left turn (4), right angle (2), sideswipe (2), and fixed object (1). The only crash pattern identified is three eastbound left turn crashes. The causes of the left turn crashes were generally due to failure to yield right of way or driver inattention. No other discernible crash patterns exist; thus, no geometric improvements are recommended.

2. NYS Route 212 at Churchland Road

No crashes occurred at this intersection during the study period.

4. NYS Route 212 at NYS Route 32

As shown in **Table 5**, the intersection has a crash rate that is approximately 1.04 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (8), left turn (6), head on (1), sideswipe (1), fixed object (1), and backing (1). The following crash patterns were reported:

- Rear End
  - Southbound (three crashes)
  - Westbound (three crashes)
- Left Turn
  - Eastbound (four crashes)

The reported rear end crashes (33%) are characteristic of moderate to heavily trafficked signalized intersections. The causes of the rear end crashes were generally due to driver inattention, driver error, unsafe speeds, or following too closely. One southbound rear end crash was caused by a driver's foot slipping off the brake and another was caused by driver intoxication. The causes of the left turn crashes were generally due to failure to yield right of way. In order to mitigate the existing left turn crash pattern in the eastbound direction, it is recommended that NYSDOT considers installing flashing yellow arrows for the permitted left turn phases for at least the eastbound approach. No other discernible crash patterns exist; thus, no geometric improvements are recommended.

5. NYS Route 212 at Churchland Lane

As shown in **Table 5**, the intersection has a crash rate that is equal to the statewide average crash rate for similar intersections. The following crashes occurred: rear end (4), and sideswipe (1). No discernible crash patterns exist; thus, no geometric improvements are recommended.

6. NYS Route 212 at Saugerties Manor Road

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. One crash was reported at this intersection attributed to a sideswipe collision. No discernible crash patterns exist; therefore, no geometric improvements are recommended.

7. NYS Route 212 at Stewart's Exit Driveway

As shown in **Table 5**, the intersection has a crash rate that is approximately 1.14 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: sideswipe (1), and backing (1). No discernible crash patterns exist; thus, no geometric improvements are recommended.

8. NYS Route 212 at Stewart's Enter Driveway

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. One crash was reported at this intersection attributed to a sideswipe collision. No discernible crash patterns exist; therefore, no geometric improvements are recommended.

9. NYS Route 212 at I-87 Northbound Ramps/McDonald's Driveway

As shown in **Table 5**, the intersection has a crash rate that is approximately 2.50 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (10), right angle (2), and sideswipe (8). The following crash patterns were reported:

- Rear End
  - Eastbound (seven crashes)
- Sideswipe
  - Northbound (four crashes)

The reported rear end crashes (50%) are characteristic of moderate to heavily trafficked signalized intersections. The causes of the rear end crashes were generally due to driver inattention, driver error, unsafe speeds, or following too closely. The causes of the sideswipe crashes were generally due to unsafe lane changing, failure to stay in lane, or failure to stay in lane. No other discernible crash patterns exist; thus, no geometric improvements are recommended.

10. NYS Route 212 at Pizza Star Exit Driveway

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. The following crashes occurred: right turn (1), and sideswipe (1). No discernible crash patterns exist; therefore, no geometric improvements are recommended.

11. NYS Route 212 at Pizza Star Driveway

No crashes occurred at this intersection during the study period.

12. NYS Route 212 at Tomsons Road

As shown in **Table 5**, the intersection has a crash rate that is approximately 1.14 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (1), and sideswipe (1). No discernible crash patterns exist; thus, no geometric improvements are recommended.

13. NYS Route 212 at Verizon Exit Driveway

No crashes occurred at this intersection during the study period.

14. NYS Route 212 at Kings Highway/Buns Burger Driveway

As shown in **Table 5**, the intersection has a crash rate that is approximately 2.35 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (10), right angle (2), sideswipe (2), fixed object (2), and other (1). The following crash patterns were reported:

- Rear End
  - Northbound (six crashes)
  - Eastbound (three crashes)

The reported rear end crashes (59%) are characteristic of moderate to heavily trafficked signalized intersections. The causes of the rear end crashes were generally due to driver inattention, driver error, unsafe speeds, or following too closely. No other discernible crash patterns exist; thus, no geometric improvements are recommended.

15. NYS Route 212 at Mobil Driveway

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. One crash was reported at this intersection attributed to a left turn collision. No discernible crash patterns exist; therefore, no geometric improvements are recommended.

16. NYS Route 212 at Big Lots Driveway

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. The following crashes occurred: right turn (1), sideswipe (1), and animal (1). No discernible crash patterns exist; therefore, no geometric improvements are recommended.

17. NYS Route 212 at Railroad Avenue/Abbotts Court

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (4), and other (1). The only crash pattern that was reported were four eastbound rear end crashes. The causes of the rear end crashes were generally due to driver inattention, driver error, or following too closely. No other discernible crash patterns exist; therefore, no geometric improvements are recommended.

18. NYS Route 212 at Market Street

As shown in **Table 5**, the intersection has a crash rate that is approximately 1.09 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (4), left turn (1), and fixed object (1). The only crash pattern that was reported were three northbound rear end crashes. The causes of the rear end crashes were generally due to driver inattention, driver error, or following too closely. No other discernible crash patterns exist; therefore, no geometric improvements are recommended.

19. Main Street at Market Street

As shown in **Table 5**, the intersection has a crash rate that is approximately 1.80 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (6), left turn (1), right angle (1), sideswipe (3), fixed object (2), other (1), and bicycle/pedestrian (2). No discernible crash patterns exist; therefore, no geometric improvements are recommended.

20. Main Street at Partition Street

As shown in **Table 5**, the intersection has a crash rate that is approximately 1.86 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (4), sideswipe (1), fixed object (8), backing (1), and bicycle/pedestrian (1). The only crash pattern that was reported were five northbound fixed crashes. The causes of the rear end crashes were generally due to driver error or turning improperly. No other discernible crash patterns exist; therefore, no geometric improvements are recommended.

21. NYS Route 32 at I-87 Southbound Ramps/Augusta Savage Road

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (1), and sideswipe (2). No discernible crash patterns exist; therefore, no geometric improvements are recommended.

22. NYS Route 32 at Old Route 32

No crashes occurred at this intersection during the study period.

24. NYS Route 32 at Mower Mill Road

As shown in **Table 5**, the intersection has a crash rate that is lower than the statewide average crash rate for similar intersections. One crash was reported at this intersection attributed to a rear end collision. No discernible crash patterns exist; therefore, no geometric improvements are recommended.

25. NYS Route 32 at Hommelville Road/Peoples Road

As shown in **Table 5**, the intersection has a crash rate that is approximately 3.26 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (10), right angle (2), and sideswipe (8). The following crash patterns were reported:

- Rear End
  - Northbound (three crashes)
  - Southbound (four crashes)
- Left Turn
  - Southbound (four crashes)

The causes of the rear end crashes were generally due to driver inattention, driver error, unsafe speeds, or following too closely. The causes of the left turn crashes were generally due to failure to yield right of way. One southbound left turn crash was caused by sun glare hindering the drivers view. As discussed in Section 7.2 and 7.4, a traffic signal is warranted and recommended at this intersection. The installation of a traffic signal with flashing yellow arrows for the permitted left turn phases can mitigate the left turn crash clusters at this intersection.

26. NYS Route 32 at Old Kings Highway

As shown in **Table 5**, the intersection has a crash rate that is approximately 4.11 times higher than the statewide average crash rate for similar intersections. The following crashes occurred: rear end (5), left turn (6), right angle (2), sideswipe (2), and animal (1). The following crash patterns were reported:

- Rear End
  - Westbound (three crashes)
- Left Turn
  - Westbound (six crashes)

The causes of the rear end crashes were generally due to driver inattention, driver error, unsafe speeds, following too closely, or slippery conditions. The causes of the left turn crashes were generally due to failure to yield right of way or driver error. As discussed in Section 7.2 and 7.4, a traffic signal is warranted and recommended at this intersection. The installation of a traffic signal can mitigate the left turn crash cluster at this intersection.

27. NYS Route 32 at Old Route 32/Malden Turnpike

No crashes occurred at this intersection during the study period.

28. Harry Wells Road at Buffalo Road

No crashes occurred at this intersection during the study period.

5.0 BACKGROUND (NO BUILD) CONDITIONS

Background traffic volumes represent the traffic conditions during the proposed build year without development of the project. It is assumed that the development could be completed and occupied in 2028. In accordance with the DEIS Scoping Document, the analysis should be conducted for the estimated year of project completion (design year) plus 10 years. In keeping with NYSDOT standards, the design year was rounded to 2030 and prepared traffic projections for 10 years beyond the estimated time of completion (ETC+10) – 2040. Traffic volume data from various ATRs published on the NYSDOT *Traffic Data Viewer* were reviewed and an annual growth rate of +0.50%[2] was calculated. This growth

[2] NYSDOT ATR Station ID/Roadway/Growth Rate: 860027/NYS Route 32/+0.47% | 860054/NYS Route 212/-0.73% | 860055/NYS Route 32/-0.60% | 860108/NYS Route 212/+0.68% | 868009/Kings Hwy/+0.79% | 860254/NYS Route 32/+0.16%

rate, upon review and approval by the Town's Traffic Consultant, Philip Grealy, was applied to the 2023 existing calibrated volumes and compounded annually for 17 years.

The widely accepted methodology for preparing traffic impact studies requires that any projects in the study area that are currently approved and/or under construction must be considered in the traffic analysis. Projects that are contemplated but not yet approved are not typically included in a traffic analysis. Both CM and, more recently, PA contacted the Town's Planning Board Secretary, Becky Bertorelly, as well as the Town's Traffic Engineering Consultant, Philip Grealy, who identified other developments in the area that, if approved and constructed, could potentially increase traffic within the study area.[3] **Table 6** summarizes the other planned development projects that are considered in this analysis. Attachment E contains the correspondence between Passero and the Town's Planning Board Secretary.

Table 6: *Other Planned Development Projects*

Project	Type	Location	Source of Trip Generation	Total Peak Hour Trips Generated in Study Area by Projects				
				Weekday AM	Weekday PM	Friday PM	Saturday Midday	Sunday Midday
Glasco Apartments	Multifamily	Route 9W/ 260 Glasco Tpke	Colliers	57	70	70	52	46
SherLilly, LLC	Dog Training Facility	51 Industrial Drive	Daniel J Gosselin, P.E.	10	10	10	31	31

Traffic generated by these developments was added to the study intersections in addition to the annual growth rate. These resulting Background Traffic Volumes are shown on Figures 4A-4C.

6.0 PROPOSED DEVELOPMENT CONDITIONS

6.1 Project Description

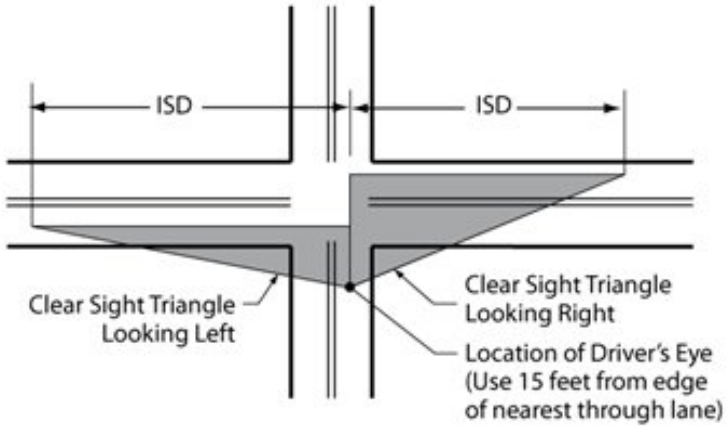
Saugerties Farm LLC is proposing to rezone ±840 acres of predominately vacant land in the General Business (GB) and Moderate Density Residential (MDR) districts to a Planned Development district (PDD). To assess any potential adverse traffic impacts due to the proposed project, three alternatives are being considered: (1) Current Zoning or as-of-right plan (AOR), (2) Sponsor's Preferred plan (SP), and (3) the Reasonable Worst-Case Scenario (RWCS).

The AOR is comprised of the following components based on the current property zoning:

- **Single Family Housing:**
  - ±773 units on approximately 419 acres
- **Commercial Development Land Use(s) zoned general business:**
  - ±26 acres
- **Access:** Provided via two driveways on NY-32 and three driveways on NY-212.

[3] According to the CM TIS, Starbucks at 334/330 Route 212 is a development that was identified by the Planning Board Secretary. However, the Town did not require a traffic study. It was assumed that traffic generated by the Starbucks development, which consists mostly of pass-by trips, would be accounted for by applying the 0.5% background growth rate.

The SP plan includes careful planning and consideration of where development should occur on the site based on a host of studies that have been commissioned by the landowners. These technical studies have been used to fine-tune the SP plan relative to the location of buildings, roads, and uses on the project site. The SP plan is comprised of the following components:



- **Residential:**
  - ±154 single family home units
  - ±110 townhouses
  - ±650 condo/apartment units
- **Commercial Development:**
  - ±419,800 square feet of commercial retail space
  - a campground with 100 cabins
  - a 150-room boutique hotel
  - a conference center with 250 hotel rooms
  - a 5,000-person amphitheater
  - ±250,000 square feet of lab or light- industrial space
- **Access:** Provided via two driveways on NY-32 and two driveways on NY-212.

The RWCS was created to show a reasonable maximum development scenario under the new proposed zoning regulations, which includes less residential homes but larger commercial and tech industrial spaces compared to the SP Plan. The RWCS plan includes the following components:

- **Residential:**
  - ±133 single family home units
  - ±115 townhouses
  - ±800 condo/apartment units
- **Commercial Development:**
  - ±425,000 square feet of commercial retail space
  - a campground with 157 cabins and RV sites
  - a 150-room boutique hotel
  - a conference center with 250 hotel rooms
  - a 5,000-person amphitheater
  - ±375,000 square feet of lab or light- industrial space
- **Access:** Provided via two driveways on NY-32 and one driveway on NY-212.

6.2 Driveway Sight Distance Evaluation

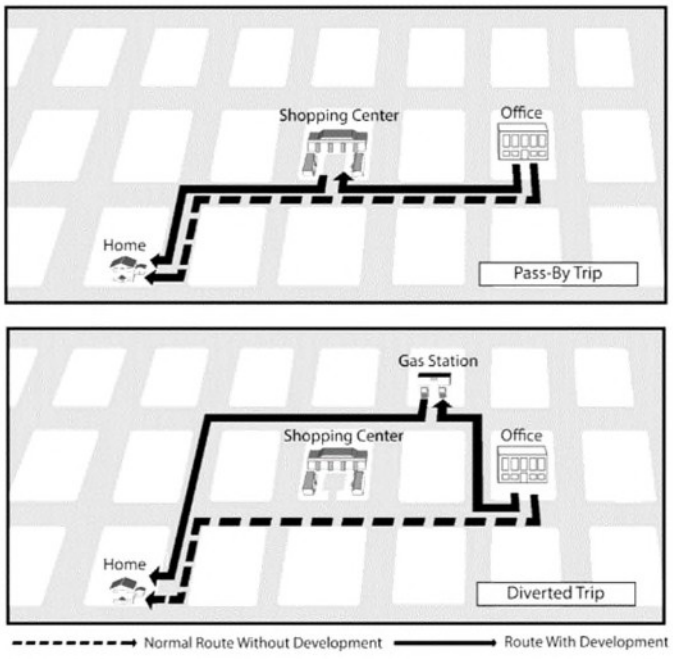
This study investigated available sight distances at the driveway locations. Sight distance is provided at intersections to allow drivers to perceive the presence of potentially conflicting vehicles. This should occur in sufficient time for a motorist to stop or adjust their speed, as appropriate, to avoid a collision at the intersection. Sight distance is also provided at intersections to allow the drivers of stopped vehicles a sufficient view of the intersecting highway to anticipate and avoid potential incidents.

If the available sight distance for an entering or crossing vehicle is at least equal to the appropriate Stopping Sight Distance (SSD) for the major road, then drivers have sufficient sight distance to anticipate and avoid collisions. To enhance traffic operations, Intersection Sight Distances (ISD) that exceed that exceed SSD are desirable along the major road.

Sight distance is evaluated using guidance contained within the latest edition of *A Policy on Geometric Design of Highways and Streets 7th Edition* published by the American Association of State Highway and Transportation Officials (AASHTO) and the NYSDOT *Highway Design Manual* to establish the required SSD and desirable ISD. The recommended sight distances are based on a road's design speed (posted plus 5 mph).

All site driveways will be signalized thereby eliminating most sight distance concerns. As each phase of the project goes through the site planning process and updated traffic studies are provided, they should look closely at the access points at that time to determine if right turn on red movements should be prohibited due to sight distance concerns.

6.3 Trip Generation



The volume of traffic generated by a site is dependent on the intended land use and size of the development. Trip generation is an estimate of the number of trips generated by a specific building or land use. These trips represent the volume of traffic entering and exiting the development.

The latest *Trip Generation Manual 11th Edition* published by the ITE is the industry standard and is used as a reference for this information. The trip rate for the peak hour of the generator may or may not coincide in time or volume with the trip rate for the peak hour of adjacent street traffic. Volumes generated during the peak hour of the adjacent street traffic, adjacent existing land uses, and the proposed project represent a more critical volume when analyzing the capacity of the system; those intervals will provide the basis of this analysis.

In order to provide a realistic estimate of trip generation, various credits were considered including Internal Capture, Pass-By, and Diverted- Link. These are discussed in more detail below.

Internal Capture – The ITE's *Trip Generation Handbook*, 3rd Edition, states that in mixed-use developments, such as that identified in the Winston Farm PDD, individual land uses tend to interact by attracting a portion of each other's trip generation, which is referred to as Internal Capture. For example, a resident of the PDD visiting the commercial uses available on-site. These internal trips occur internally to the site and do not impact the public roadway network. Using

the ITE methodology and published internal capture rates, internal trips were calculated for each of the study peak hours under all three scenarios (AOR, SP, RWCS). It should be noted that internal capture was calculated separately for the northeastern and southern areas of the proposed site, because there is no internal cross-access between them and trips visiting both areas would impact the adjacent roadway system.

Pass-By and Diverted Link – ITE's Trip Generation Handbook also states that not all traffic entering or exiting a site driveway is necessarily new traffic added to the roadway system. For example, the top image to the right shows a *shopping center* that is expected to attract traffic already traveling on the adjacent roadway to make an intermediate stop before continuing the original path towards their primary destination. These trips are referred to as Pass-by trips and they are not new to the overall roadway network.

Additionally, the bottom image above shows a *gas station* that is expected to attract traffic already traveling within the vicinity requiring them to divert from their original path in order to access the site before returning to the normal path towards their primary destination. These trips are referred to as Diverted Link trips, and they add traffic to streets adjacent to a site while removing trips on nearby streets. Based on ITE published data, appropriate rates for pass-by and diverted link trips were applied to the commercial trip generation for each of the analysis peak hours under all three scenarios. It should be noted that the ITE pass-by and diverted rates were adjusted such that the pass-by volumes didn't exceed 10% of the adjacent roadway traffic volumes at each site driveway.

Table 7 summarizes the overall peak hour trip generation of the subject site under all three scenarios, after accounting for internal capture, pass-by trips, and diverted link trips. These trips are referred to as Primary trips. Please note that no transit trip reductions were applied in this report.

Table 7: *Peak Hour Site Generated Trip Generation Summary*

Scenario		Weekday AM Peak Hour			Weekday PM Peak Hour			Friday PM Peak Hour			Saturday Midday Peak Hour			Sunday Midday Peak Hour

Table 7 shows that under the AOR scenario, the project would generate the fewest amount of peak hour trips. Under the SP scenario, the project would generate more trips than under AOR scenario during each of the study peak hours with the lowest difference being 371 total trips and the greatest difference being 662 total trips. Finally, under the RWCS scenario, the project would generate more trips than under both the AOR and SP scenarios during each of the study peak hours. Detailed trip generation tables summarizing the peak hour and daily trip generation, the applicable ITE Land Use Codes, and applicable trip reductions, which are discussed herein, for each scenario are provided in the attachments.

The AOR scenario is expected to generate approximately 327 entering/494 exiting vehicle trips during the AM peak hour, 592 entering/431 exiting vehicle trips during the PM peak hour, 671 entering/450 exiting vehicle trips during the Friday peak hour, 668 entering/714 exiting vehicle trips during the Saturday peak hour, and 521 entering/495 exiting vehicle trips during the Sunday peak hour. The SP scenario is expected to generate approximately 645 entering/583 exiting vehicle trips during the AM peak hour, 810 entering/781 exiting vehicle trips during the PM peak hour, 926 entering/856 exiting vehicle trips during the Friday peak hour, 933 entering/856 exiting vehicle trips during the Saturday peak hour, and 681 entering/706 exiting vehicle trips during the Sunday peak hour. The RWCS scenario is expected to generate approximately 754 entering/642 exiting vehicle trips during the AM peak hour, 873 entering/853 exiting vehicle trips during the PM peak hour, 952 entering/881 exiting vehicle trips during the Friday peak hour, 999 entering/915 exiting vehicle trips during the Saturday peak hour, and 775 entering/803 exiting vehicle trips during the Sunday peak hour.

6.4 Trip Distribution

The cumulative effect of site generated traffic on the transportation network is dependent on the origins and destinations of that traffic and the location of the access drives serving the site. Trip distribution patterns determined in the March 8, 2024 CM TIS were used for this analysis. The following explains the methodology used in the CM TIS.

Traffic generated by the project was distributed throughout the adjacent roadway system based on potential travel patterns and places of interest for the future users of the project. The analysis assumes that the commercial and residential components will attract approximately 50% of their trips from "inner town" local roads and 50% from I-87, while the hotel and recreational components will attract approximately 80% of their trips from I-87 and 20% from local roads. Pass-by trips were assumed to occur mostly via Augusta Savage Road rather than the NYS Route 212 site driveway since the commercial uses would be located along the NYS Route 32 frontage. Diverted Link trips were added to the I-87 northbound and southbound ramps to account for motorists diverting from their typical route to visit the site.

It should be noted that the same general trip distributions were used for the SP and RWCS analyses. For the AOR analysis, the overall regional distribution was maintained; however, the local distributions at the study intersections were modified to account for differences in the access driveway location. These distributions are illustrated on Figures 5A-5I.

6.5 Trip Assignment

The site-generated traffic volumes associated with the AOR scenario were assigned to the study roadway network as shown on Figures 6A-6L for pass- by and diverted link trips and Figures 6M-6O for the total site generated trips. Similarly, the site-generated traffic volumes associated with the SP scenario were assigned to the study roadway network as shown on Figures 6P-6AA for pass-by and diverted link trips and Figures 6AB-6AD for the total site generated trips. Lastly, the site-generated traffic volumes associated with the RWCS scenario were assigned to the study roadway network as shown on Figures 6AE-6AP for pass-by and diverted link trips and Figure 6AQ-6AS for the total site generated trips.

6.6 Full Development Volumes

The proposed design hour traffic volumes are developed for the peak hours by combining the background traffic conditions (**Figures 4A-4C**) and the new AOR site-generated traffic volumes (**Figures 6M-6O**) to yield the traffic volumes under 2040 Build Traffic Volumes (AOR) condition, the new SP site-generated traffic volumes (**Figures 6AB-6AD**) to yield the traffic volumes under 2040 Build Traffic Volumes (SP) condition, and the new RWCS site-generated traffic volumes (**Figures 6AQ-6AS**) to yield the traffic volumes under 2040 Build Traffic Volumes (RWCS) condition.

The 2040 Build Traffic Volumes (AOR) are shown on Figures 7A-7C, the 2040 Build Traffic Volumes (SP) are shown on Figures 7D-7F, and the 2040 Build Traffic Volumes (RWCS) are shown on Figures 7G-7I.

7.0 TRAFFIC OPERATIONS AND ANALYSIS

7.1 Left-Turn Warrant Analysis

This study used the Transportation Research Board's (TRB) *NCHRP Report 279 Intersection Channelization Design Guide* to evaluate the volume warrants for a left-turn treatment at the NY-212/Proposed Easterly Driveway, NY-212/Proposed Westerly Driveway, and NY-32/Proposed Driveway intersections under the Sponsor's Preferred full build conditions. Provisions for left-turn lane facilities should be established where traffic volumes are high enough and safety considerations are sufficient to warrant the additional lane. This investigation analyzed warrants during the weekday AM and PM, Friday, Saturday, and Sunday peak hours for the intersections under the Sponsor's Preferred full development conditions. The left-turn warrants are based on a combination of the percentage of left-turning traffic, advancing traffic, opposing traffic, and the design speed of the major roadway (posted speed plus 5 mph) at the study intersections.

The combination of eastbound traffic volumes turning left into the proposed easterly driveway from NY-212 and the design speed of NY-212 indicate that a left-turn treatment is warranted during all peak hours under full development conditions. Given that, it is recommended that an eastbound left-turn lane is constructed at this intersection.

The combination of eastbound traffic volumes turning left into the proposed westerly driveway from NY-212 and the design speed of NY-212 indicate that a left-turn treatment is not warranted during all peak hours under full development conditions.

The combination of northbound traffic volumes turning left into the proposed driveway from NY-32 and the design speed of NY-32 indicate that a left-turn treatment is warranted during all peak hours under full development conditions. Given that, it is recommended that a northbound left-turn lane is constructed at this intersection.

7.2 Traffic Signal Warrant Investigation

A traffic signal warrant analysis was performed at the existing NY-32/Peoples Rd/Hommelville Rd and NY-32/Old Kings Hwy intersections under existing, background, and the Sponsor's Preferred full build conditions and at the NY-212/Proposed Easterly Driveway and NY-32/Proposed Driveway intersections under the Sponsor's Preferred full build conditions. The need for a traffic signal is determined by comprehensive investigation of existing traffic conditions and physical characteristics at the location. The *Standard Specifications Update for the adoption of the National MUTCD (FHWA)* and the *New York State Supplement* were reviewed to investigate the need for a traffic control signal at these locations. There are nine (9) warrants, and they are as follows:

- Warrant 1 Eight-Hour Vehicular Volume
- Warrant 2 Four-Hour Vehicular Volume
- Warrant 3 Peak Hour Vehicular Volume
- Warrant 4 Pedestrian Volume
- Warrant 5 School Crossing
- Warrant 6 Coordinated Signal System
- Warrant 7 Crash Experience
- Warrant 8 Roadway Network
- Warrant 9 Intersection Near a Grade Crossing

Prior to applying warrants, the MUTCD suggests consideration of the effects of right-turn volumes on the minor street approach, and a 20% reduction was taken in the number of right-turn vehicles exiting the minor street approach at each intersection. 24-hour bi-directional data collected by NYSDOT in 2018 and 2019 was used to determine the hourly distribution of traffic along NY-212 and NY-32, respectively, for the signal warrant at all intersections. The hourly distribution of traffic on Old Kings Hwy is based on 24-hour southbound data collected by NYSDOT in 2024. The hourly distribution of traffic on Mineral Springs Rd is based on 24-hour northbound data collected by NYSDOT in 2023. ITE data was used to project the hourly distribution of traffic exiting the proposed easterly driveway along NY-212 and the proposed driveway along NY-32. Based on the existing speed limit of 40 MPH on NY-212 and 55 MPH on NY-32, 70% thresholds in Table 4C-1, Figure 4C-2, and Figure 4C-4 of the MUTCD are used as a basis for analysis to be conservative.

1. Warrant 1 is subdivided into Condition A and Condition B. The Minimum Vehicular Volume, Condition A, is intended for application at locations where a large volume of intersecting traffic is the principal reason to consider installing a traffic control signal. The Interruption of Continuous Traffic, Condition B, is intended for application at locations where Condition A is not satisfied and where the traffic volume on a major street is so heavy that traffic on a minor intersecting street suffers excessive delay or conflict in entering or crossing the major street. These conditions are satisfied when, for each of any eight hours of an average day, anticipated volumes on the artery and side road are more than the minimum values presented in Tables 4C-1 in the MUTCD.
    - **At the existing NY-32/Peoples Rd/Hommelville Rd intersection, the warrant for Condition A is not met under any condition, and the warrant for Condition B is only met under full build conditions.**
    - **At the existing NY-32/Old Kings Hwy intersection, the warrant for Condition A is met under all conditions, and the warrant for Condition B is also met under all conditions.**
    - **At the NY-212/Proposed Easterly Driveway intersection, the warrant for Condition A is met under full build conditions, and the warrant for Condition B is also met under full build conditions.**

- **At the NY-32/Proposed Driveway intersection, the warrant for Condition A is met under full build conditions, and the warrant for Condition B is also met under full build conditions.**

2. Warrant 2, the Four-Hour Vehicular Volume signal warrant conditions, are intended to be applied where the volume of intersecting traffic is the principal reason to consider installing a traffic control signal. This warrant stipulates that for any four hours of a day, minimum threshold volumes are met on the artery and side road.
    - **At the existing NY-32/Peoples Rd/Hommelville Rd intersection, this warrant is only met under full build conditions.**
    - **At the existing NY-32/Old Kings Hwy intersection, this warrant is met under all conditions.**
    - **At the NY-212/Proposed Easterly Driveway intersection, this warrant is met under full build conditions.**
    - **At the NY-32/Proposed Driveway intersection, this warrant is met under full build conditions.**

3. Warrant 3 is intended for applications where minor street traffic suffers undue delay in entering or crossing the major street for one hour of the day. It stipulates that the warrant shall be applied in unusual cases (high-occupancy vehicle facilities – i.e., shopping centers, office parks) where a large number of vehicles discharge over a short period of time. The need for a traffic control signal shall be considered if the criteria in *either* of the following two categories are met:
    a. If all three of the following conditions exist for the same 1 hour (any four consecutive 15-minute periods) of an average day:
        i. The total stopped-time delay experienced by the traffic on one minor-street approach (one direction only) controlled by a STOP sign equals or exceeds: 4 vehicle-hours for a one-lane approach or 5 vehicle-hours for a two-lane approach, and

        ii. The volume on the same minor-street approach (one direction only) equals or exceeds 100 vehicles per hour for one moving lane of traffic or 150 vehicles per hour for two moving lanes, and

        iii. The total entering volume serviced during the hour equals or exceeds 650 vehicles per hour for intersections with three approaches or 800 vehicles per hour for intersections with four or more approaches.

    b. The plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the more critical minor-street approach (one direction only) for 1 hour (any four consecutive 15-minute periods) of an average day falls above the applicable curve in Figure 4C-4 for the existing combination of approach lanes.
    - **At the existing NY-32/Peoples Rd/Hommelville Rd intersection, this warrant is only met under full build conditions.**
    - **At the existing NY-32/Old Kings Hwy intersection, this warrant is met under all conditions.**
    - **At the NY-212/Proposed Easterly Driveway intersection, this warrant is met under full build conditions.**
    - **At the NY-32/Proposed Driveway intersection, this warrant is met under full build conditions.**

4. Warrant 4 is met when pedestrians experience excessive delay in crossing the major street because the traffic volumes are so heavy. The intersections currently have low pedestrian activity which is not likely to increase significantly under future development. **This warrant is not met at either intersection.**

5. Warrant 5 is met when a sufficient number of gaps in traffic do not exist for certain size and frequency of school children to cross the major roadway. **This warrant is not met at any study intersection.**

6. Warrant 6 is met when a traffic signal is needed to maintain progressive movement and vehicle platooning in a coordinated signal system. T**his warrant is not met at any study intersection**.

7. Warrant 7 is intended for application where the severity and frequency of crashes are the principal reasons to consider installing a traffic control signal. The need for a traffic control signal shall be considered if *all* of the following criteria are met:

    a. Adequate trial of alternatives with satisfactory observance and enforcement has failed to reduce crash frequency.

    b. At least one of the following conditions applies to the reported crash history (where each reported crash considered is related to the intersection and apparently exceeds the applicable requirements for a reportable crash).

        i. The number of reported angle crashes and pedestrian crashes within a 1-year period equals or exceeds the threshold number in Table 4C-4 for total angle crashes and pedestrian crashes (all severities); or

        ii. The number of reported fatal-and-injury angle crashes and pedestrian crashes within a 1-year period equals or exceeds the threshold number in Table 4C-4 for total fatal-and-injury angle crashes and pedestrian crashes; or

        iii. The number of reported angle crashes and pedestrian crashes within a 3-year period equals or exceeds the threshold number in Table 4C-5 for total angle crashes and pedestrian crashes (all severities); or

        iv. The number of reported fatal-and-injury angle crashes and pedestrian crashes within a 3-year period equals or exceeds the threshold number in Table 4C-5 for total fatal-and-injury angle crashes and pedestrian crashes; and

    c. For each of any 8 hours of an average day, the vehicles per hour (vph) given in both of the 80 percent columns of Condition A in Table 4C-1 (see Section 4C.02), or the vph in both of the 80 percent columns of Condition B in Table 4C-1 exists on the major street and the more critical minor-street approach, respectively, to the intersection, or the volume of pedestrian traffic is not less than 80 percent of the requirements specified in the Pedestrian Volume warrant (see Section 4C.05).

        Crash data for the existing NY-32/Peoples Rd/Hommelville Rd and NY-32/Old Kings Hwy intersections was obtained from NYSDOT and reviewed for the time period from October 1, 2019, through September 30, 2024. Review of the crash data indicates that this warrant is met at both intersections.

8. Warrant 8 is met when a traffic signal might encourage concentration and organization of traffic flow on a roadway network. This warrant primarily focuses on two major intersecting roadways, which is not the case at any of the study intersections. **This warrant is not met at any study intersection.**

9. Warrant 9 is applicable when an intersection is located near an at-grade rail crossing. **This warrant is not met at any study intersection.**

Table 8 summarizes the signal warrant findings at the four intersections evaluated. Based upon the results, a traffic signal is warranted at all four intersections under full build conditions. In order to determine the optimal mitigation for these intersections, the installation of a traffic signal and a roundabout were considered at these locations. The results of this analysis and the recommended mitigation are discussed in Section 7.4.

Table 8: *Signal Warrant Analysis Results*

WARRANT	SATISFACTION OF WARRANTS					
	NY-32/PEOPLES RD/HOMMELVILLE RD			NY-32/OLD KINGS HWY

7.3 Roundabout Feasibility Analysis

A feasibility evaluation for roundabouts was performed at the following intersections:

- NYS Route 32/Old Kings Highway
- NYS Route 32/Peoples Road
- NYS Route 32/Northeast Area Driveway
- NYS Route 32/Augusta Savage Road/Interstate-87 SB Ramp
- NYS Route 32/NYS Route 212
- NYS Route 212/South Area Driveway

These intersections were selected as the project proposes to either improve them with a signal, or they are considered key intersections.

The feasibility evaluation was performed according to the capacity thresholds detailed in Exhibits 26-1 "Traffic Volumes Thresholds" and 26-2 "Capacity Limits for Roundabouts" from Chapter 26 of the NYSDOT Highway Design Manual (NYSDOT HDM). The former of these exhibits bases the feasibility of a roundabout on the Intersection ADT, while the latter bases the feasibility of a roundabout on the comparison of peak hour entering traffic against peak hour circulating traffic as the ability for vehicles approaching the roundabout to find sufficient gaps in the circulating traffic, which tends to limit the capacity of a roundabout. **Table 9** summarizes the estimated intersection ADT and the maximum sum of entering traffic and circulating traffic. Table 9 then provides the resulting guidance based on those two metrics.

Table 9: *Feasibility Evaluation for Roundabouts*

Intersection	Estimated ADT	NYSDOT Guidance Per Exhibit 26-1	Max. Sum of Entering and Circulating Peak Hour Traffic Volumes	NYSDOT Guidance Per Exhibit 26-2
NYS Route 32/ Old Kings Hwy	15,516 vpd	• Single-Lane Roundabout likely to operate acceptably	914 vph (NY Route 32 NB Approach)	• Single-Lane Roundabout is acceptable
NYS Route 32/ Peoples Rd	17,482 vpd	• Single-Lane Roundabout may be sufficient • Double-Lane Roundabout likely to operate acceptably	986 vph (Peoples Rd WB Approach)	• Single-Lane • Roundabout is acceptable
NYS Route 32/ NE Area Dwy	19,571 vpd	• Single-Lane Roundabout may be sufficient • Double-Lane Roundabout likely to operate acceptably	1,162 vph (NY-32 NB Approach)	• Single-Lane Roundabout is acceptable, but may require right-turn only • lanes
NYS Route 32/ Augusta Savage Rd/ I-87 SB Ramp	36,617 vpd	• Double-Lane Roundabout may be sufficient	1,893 vph (I-87 WB Approach)	Double-Lane Roundabout is acceptable
NYS Route 32/ NYS Route 212	31,280 vpd	• Double-Lane Roundabout likely to operate acceptably	1,612 vph (NY-212 WB Approach)	• Double-Lane • Roundabout is acceptable

Intersection	Estimated ADT	NYSDOT Guidance Per Exhibit 26-1	Max. Sum of Entering and Circulating Peak Hour Traffic Volumes	NYSDOT Guidance Per Exhibit 26-2
NYS Route 212/ S Area Dwy	10,549 vpd	• Single-Lane Roundabout likely to operate acceptably	635 vph (NY-212 WB Approach)	Single-Lane Roundabout is acceptable

As shown in Table 9, all intersections are likely to operate sufficiently as either a single-lane or double-lane roundabout depending on the intersection ADT. It should be noted that the geometric feasibility, i.e. the constructability of a roundabout, was not investigated at this time. For the purposes of this study, detailed operational analyses of these intersections were not conducted. Rather, capacity improvements and/or phasing and timing changes were explored to mitigate operational constraints expected under the 2040 Sponsors Preferred Build conditions. A more detailed evaluation should be conducted as traffic studies are updated during the site plan approval processes in the future.

7.4 Special Event Traffic

It is anticipated that the majority of special events at the proposed venue will occur outside of the studied peak hours either on weekday evenings or Saturdays/Saturday evenings. As such, it was assumed that any special event traffic that would occur during the peak hours would be negligible.

As the proposed development moves through the future site plan review process, detailed design related to the number of parking spaces, appropriate on and off-site wayfinding, and the need for temporary event traffic control should be evaluated.

7.5 Description of Capacity Analysis

Capacity analysis is a technique used for determining a measure of effectiveness for a section of roadway and/or intersection based on the number of vehicles during a specific time period. The measure of effectiveness used for the capacity analysis is referred to as a Level of Service (LOS). Levels of service are calculated to provide an indication of the amount of delay that a motorist experiences while traveling along a roadway or through an intersection. Since the most amount of delay to motorists usually occurs at intersections, capacity analysis focuses on intersections, as opposed to highway segments.

The standard procedure for capacity analysis of signalized and unsignalized intersections is outlined in the latest *Highway Capacity Manual (HCM) 7th Edition* published by the Transportation Research Board (TRB). Traffic analysis software, Synchro 12, which is based on procedures and methodologies contained in the HCM, was used to analyze operating conditions at study area intersections. The procedure yields a Level of Service based on the HCM as an indicator of how well intersections operate.

Six levels of service are defined for analysis purposes. They are assigned letter designations, from A to F, with LOS A representing the conditions with little to no delay, and LOS F conditions with very long delays. LOS C or better is desirable, but LOS D for signalized locations and LOS E for unsignalized locations are generally thresholds of acceptable operation during peak periods so long as the volume to capacity ratio (v/c) is below 1.0. **Table 10** depicts Level of Service criteria for both signalized and unsignalized intersections and associated delays per vehicle in seconds.

Table 10: *Level of Service Criteria*

LOS	Signalized Control	Unsignalized Control
A	< 10	< 10
B	10 – 20	10 – 15
C	20 – 35	15 – 25
D	35 – 55	25 – 35
E	55 – 80	35 – 50
F	> 80	> 50

LOS for signalized intersections is defined in terms of delay specifically, average total delay per vehicle for a 15-minute analysis period. LOS for unsignalized intersections, however, are different from a signalized intersection. The primary reason for this is driver expectation that a signalized intersection is designed to carry higher volumes than an unsignalized intersection. Unsignalized intersections are also associated with more uncertainty for users, as delays are less predictable than they are at signals.

The v/c ratio, also referred to as degree of saturation, represents the sufficiency of an intersection to accommodate the vehicular demand. A v/c ratio less than 0.85 generally indicates that adequate capacity is available, and vehicles are not expected to experience significant queues and delays. As the v/c ratio approaches 1.0, traffic flow may become unstable, and delay and queuing conditions may occur.

This evaluation was supplemented with traffic simulation modeling using an extension of Synchro called SimTraffic. During simulation modeling, vehicles are individually tracked, and statistics are recorded on a second-by-second basis to determine the delays each vehicle experiences. Since SimTraffic simulation modeling is microscopic and stochastic, meaning car movement parameters vary randomly within a set distribution based on an initial seed number, the same traffic volume may result in slightly different results depending on the random seed used. Therefore, simulation results are reported based on an average value of multiple simulation runs to reduce the variability in results.

7.6 Capacity Analysis Results

Existing and background operating conditions during the peak study periods are evaluated to determine a basis for comparison with the projected future conditions. The future traffic conditions generated by the project were analyzed to assess the operation of the study area intersections. Capacity results for existing, background, and the three 2040 Build Conditions (AOR, SP, and RWCS) are listed in **Table 11**. The discussion following the table summarizes capacity conditions. The detailed Synchro capacity analysis worksheets are contained in the Attachments.

1. A(2.8) = Level of Service (Delay in second
2. NB = Northbound, SB = Southbound, EB
3. (S) = Signalized; (U) = Unsignalized; (R) =
4. N/A = Approach does not exist and/or wa
5. Green shaded cells indicate low delays, y
6. * = Delay is extremely large and Synchro

1. **NYS Route 212/Blue Mountain Road**: The turning movements at this unsignalized intersection currently operate at LOS C or better during all study peak hours and will continue to do so in the No-Build condition. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate at LOS C or better during all study peak hours with the exception of the southbound left movement that is projected to operate at LOS E during the AM peak hour. There are currently two southbound lanes for left and right turns on Blue Mountain Road, therefore mitigation for the AM Peak hour LOS E would involve installing a new traffic signal at this intersection. However, it is unlikely that this intersection will meet signal warrants. No mitigation is warranted or recommended as a result of the proposed development.

2. **NYS Route 212/Churchland Road**: The turning movements at this unsignalized intersection currently operate at LOS B or better during all study peak hours and will continue to do so in the No-Build condition except for the Friday peak hour; which will operate at LOS C or better. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate similarly to the No-Build condition except for the weekday PM peak hour; which will operate at LOS C or better. No mitigation is warranted or recommended as a result of the proposed development.

3. **NYS Route 212/Proposed Site Driveway**: The proposed site driveway along NYS Route 212 for the southern subarea is proposed to be signalized and would provide a single lane for the site driveway southbound approach for shared left-turn and right-turn movements onto NYS Route 212. Additionally, NYS Route 212 is proposed to be widened to provide an eastbound exclusive left-turn lane into the site. With the proposed signal, this intersection is calculated to operate with an overall LOS C or better during all study peak hours under the SP and RWCS Build conditions. Note that this driveway is not included for the AOR Build condition analysis. A signal warrant analysis was conducted for this intersection and is discussed in a subsequent section of this report.

4. **NYS Route 212/NYS Route 32/Speedway Driveway:** This signalized intersection currently operates at LOS C or better on all approaches during all study peak hours and will continue to do so in the No-Build condition. Under the Sponsors Preferred (SP) and Reasonable Worst-Case Scenario (RWCS) build conditions, all approaches are projected to operate at LOS D or better with the exception of the southbound thru/left movement which is projected to operate at LOS F during all peak hours. Under the and the As-of-Right (AOR) Build conditions, all approaches are projected to operate at LOS D or better with the exception of the southbound thru/left movement which is projected to operate at LOS E during the AM peak hour and LOS F during all other peak hours. The increase in delay is attributed to the southbound left-turn movement which experiences increased traffic volumes as a result of this project. Potential improvements at this intersection include changing the southbound lane geometry such that the through movements are shared with the right turns instead of the left turns.

5. **NYS Route 212/Churchland Lane:** The turning movements at this unsignalized intersection currently operate at LOS C or better during all study peak hours and will continue to do so in the No-Build condition. Under the SP and RWCS build conditions, this intersection's turning movements will operate at LOS C or better during the study peak hours except during the Saturday midday peak hour when the southbound approach will operate at LOS E during. Under the AOR Build condition, this intersection's turning movements will operate at LOS C or better during the study peak hours except for the Saturday midday peak hour when the southbound approach will operate at LOS D or better. Because the LOS degradation to a LOS E or worse is contained to one peak hour, mitigation was not explored for this intersection. Mitigation would require signalization of the intersection however, given the extremely low volume of traffic exiting Churchland Lane, it is unlikely that this intersection would meets signal warrants.

6. **NYS Route 212/Unsignalized driveways (8 intersections between I-87 overpass and Big Lots Driveway)**
   - **NYS Route 212/Saugerties Manor Road:** The turning movements at this unsignalized intersection currently operate at LOS D or better during the study peak hours. Under the No-Build condition, all approaches are projected to operate at LOS D or better during all peak hours except during the Friday peak hour when the southbound approach is projected to operate at LOS E. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate at LOS F or better during the study peak hours except for the weekday AM peak hour when will operate at LOS E or better. It should be noted that the maximum number of trips approaching from Saugerties Manor Road is six in one peak hour or one vehicle every ten minutes. The likely factor for the poor LOS is the lack of available gaps resulting in drivers being delayed. However, given the low volume of traffic on Saugerties Manor Road a signal will likely not be warranted for this intersection.
   - **NYS Route 212/Stewart Egress:** The turning movements at this unsignalized intersection currently operate at LOS C or better during all peak hours, and will continue to do so in the No-Build condition. Under the SP and RWCS Build conditions, this intersection's turning movements will operate at LOS C or better during the weekday AM peak hour, LOS C or better during all peak hours except the Friday peak hour which is projected to operate at LOS D. Under the AOR Build condition, this intersection's turning movements will operate LOS C or better during all peak hours. No mitigation is warranted or recommended at this location as a result of the proposed development.
   - **NYS Route 212/Pizza Star Egress:** The turning movements at this unsignalized intersection currently operate at LOS C or better during all study peak hours and will continue to do so in the No-Build and throughout the SP, RWCS, and AOR Build conditions. It is noted that no turning movements occurred at this intersection during the weekday AM peak hour.
   - **NYS Route 212/Pizza Star Driveway:** The turning movements at this unsignalized intersection currently operate at LOS A during the weekday AM, PM and Sunday peak hours and LOS D or better during the Friday and Saturday midday peak hours. Under the No-Build condition, this intersection's turning movements will operate similarly to the current condition during the study peak hours except for the Friday and Saturday midday peak hours; they will operate at LOS E or better. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate similarly to the No-Build condition during the study peak hours except for the Friday and Saturday midday peak hours; they will operate at LOS F or better. It is noted that no turning movements occurred at this intersection during the weekday AM peak hour.
     Considering the location of the two Pizza Star driveways which are in very close proximity to two adjacent signals, no mitigation is warranted or recommended. If/when this property is redeveloped in the future, the Town should consider requiring cross connection to one or both of the adjacent properties and eliminating one or both of the site driveways to reduce congestion and improve safety along NYS Route 212.
   - **NYS Route 212/Tomsons Road:** The turning movements at this unsignalized intersection currently operate at LOS B or better during all study peak hours and will continue to do so in the AOR Build conditions. Under the SP and RWCS Build conditions, the southbound approach changes from LOS B to C during the Friday peak hour, however this is considered a borderline condition as the threshold between LOS C and C is 15.0 seconds per vehicle and the actual increase in delay projected is 1.2 seconds. No mitigation is warranted or recommended at this location as a result of the proposed project.
   - **NYS Route 212/Verizon Egress:** The turning movements at this unsignalized intersection currently operate at LOS B or better during all study peak hours and will continue to do so in the No-Build and throughout the SP, RWCS, and AOR Build conditions.
   - **NYS Route 212/Mobil Driveway:** The turning movements at this unsignalized intersection currently operate at LOS C or better during all study peak hours and will continue to do so in the No-Build condition. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate similarly to the No-Build condition during the study peak hours except for the Friday peak hours; they will operate at LOS D or better.

9. **NYS Route 212/I-87 Northbound Ramp/McDonalds Driveway:** All approaches at this intersection currently operate at LOS D or better during all peak hours except the NB left turn movement exiting the I-87 off-ramp which operates at LOS E during the AM peak hour. It is noted that the threshold between LOD D and E is 55.0 seconds and the northbound left turn movements operate with delays that fluctuate between 54 and 56 seconds during the AM, PM and Friday peak hours under existing and background conditions. Additionally, the northbound thru/right turn movement changes from LOS D to E and/or F and the eastbound through movement changes to LOS E during the Saturday peak hour under all three development conditions. Proposed mitigation includes adding a northbound right turn lane and signal timing adjustments which result in operating conditions that are similar to background conditions.

14. **NYS Route 212/Kings Highway/Buns Burger Driveway:** This intersection currently operates at LOS C or better on all approaches with he exception of the northbound left/thru movement which operates at LOS E during the AM, PM, and Friday peak hours. Under the AOR, SP and RWCS build conditions, the northbound left/thru movement changes to LOS F during the Friday peak hour. Minor signal adjustments result in operating conditions that are similar to background conditions.

16. **NYS Route 212/Big Lots Driveway:** This signalized intersection currently operates with an overall LOS A during the weekday AM peak hour and overall LOS B during the other study peak hours and will continue to do so in the No-Build and throughout the SP, RWSC, and AOR conditions. All movements are calculated to operate acceptably at this intersection; however, due to its close proximity to other signalized intersections on NYS Route 212, it was included in the potential improvements discussed in the following section of this report.

17. **NYS Route 212/Railroad Avenue/Abbotts Court:** The turning movements at this unsignalized intersection currently operate at LOS D or better during all study peak hours and will continue to do so in the No-Build condition. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate similarly to the No-Build conditions during all study peak hours.

18. **NYS Route 32/Market Street**: This signalized intersection currently operates with an overall LOS B during all study peak hours and will continue to do so in the No-Build condition. Under the SP, RWCS, and AOR Build conditions, this intersection will operate similarly to the No-Build condition during all study peak hours.

19. **NYS Route 32/Main Street/Market Street:** This signalized intersection currently operates with an overall LOS B during all peak hours. Under the No-Build and SP, RWCS, and AOR Build conditions, this intersection will continue to operate with an overall LOS B during all peak hours.

20. **Main Street/Partition Street**: This signalized intersection currently operates with an overall LOS B during the study peak hours. Under the background (no-build) conditions all approaches operate at LOS C or better. Under the various build condition scenarios, several approaches change from LOS B to C, however these are considered borderline conditions as the threshold between LOS B and C is 15.0 seconds and the increases in delay are less than 5 seconds.

21. **NYS Route 32/I-87 Southbound Ramp/Augusta Savage Road (Site Driveway):** This signalized intersection currently operates with an overall LOS B during the study peak hours and will continue to do so in the No-Build condition except for the Friday and Sunday midday peak hours; it will operate with an overall LOS C and D respectively.

As part of this project, geometric and signal timing improvements are proposed at this signal. Specifically, the Augusta Savage Road eastbound approach is proposed to be widened to provide one (1) exclusive left-turn lane, one (1) exclusive through lane, and one (1) exclusive right-turn lane; the I-87 ramp westbound approach is proposed to be widened to provide one (1) exclusive left-turn lane, one (1) exclusive through lane, and one (1) exclusive right-turn lane; and the NYS Route 32 southbound approach is proposed to be widened to provide one (1) exclusive left-turn lane, one (1) exclusive through lane, and one (1) exclusive right-turn lane. In other words, all approaches at the signal would provide an exclusive lane for each movement. Additionally, the signal cycle length and phase splits would be optimized for each of the study peak hours. With the proposed improvements, this intersection is calculated to operate with an overall LOS D during the weekday SAT peak hour and overall LOS C during the other study peak hours under the SP and RWCS Build conditions.

22. **NYS Route 32/Old Route 32**: The turning movements at this unsignalized intersection currently operate at LOS B or better during all study peak hours and will continue to do so in the No-Build condition except for the Sunday midday peak hour; they will operate at LOS C or better. Under the SP, RWCS and AOR Build condition, this intersection's turning movements will operate at LOS C or better during all study peak hours.

23. **NYS Route 32/NEA Driveway:** The proposed site driveway along NYS Route 32 for the northeastern subarea is also proposed to be signalized and would provide one (1) exclusive left-turn lane and one (1) exclusive right-turn lane for the site driveway eastbound approach. Additionally, NYS Route 32 is proposed to be widened to provide a northbound exclusive left-turn lane into the site. With the proposed signal, this intersection is calculated to operate with an overall LOS C or better during all study peak hours under the SP and RWCS Build conditions with the exception of the Sunday peak hour which is projected to operate at overall LOS D. Note that this driveway is not included for the AOR Build condition analysis. A signal warrant analysis was conducted for this intersection and is discussed in section 7.2 of this report.

24. **NYS Route 32/Mower Mill Road**: The turning movements at this unsignalized intersection currently operate at LOS B or better during the weekday AM, PM, Friday, and Saturday midday peak hours and LOS C or better during the weekday Sunday midday peak hour and will continue to do so in the No-Build condition. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate at LOS C or better during all peak hours.

25. **NYS Route 32/Peoples Road/Hommelville Road**: The turning movements at this unsignalized intersection currently operate at LOS D or better during all study peak hours. Under the No-Build condition, this intersection's turning movements will operate at LOS E or better during the weekday PM peak hour and LOS D or better during the other study peak hours. Under the SP, RWCS, and AOR Build conditions, the main line movements will operate similarly with the No-Build condition, but the Peoples Road westbound approach movements will operate at LOS E and F during all study peak hours. Additionally, the Hommelville eastbound approach movements will operate at LOS F during the weekday PM and Saturday midday peak hours. Signal warrants are met at this intersection as described in Section 7.2 and a new signal is recommended as mitigation at this location. Potential improvements at this intersection are discussed in greater detail in the following section of this report.

26. **NYS Route 32/CR 34 (Old Kings Highway)**: The turning movements at this unsignalized intersection currently operate at LOS C or better during the weekday AM and Saturday midday peak hours and LOS D or better during the weekday PM, Friday, and Sunday midday peak hours. Under the No-Build condition, this intersection's turning movements will operate at LOS C or better during the weekday AM and Saturday midday peak hours and LOS E or better during the weekday PM, Friday, and Sunday midday peak hours. Under the SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate at LOS E or better during the weekday AM peak hour and LOS F or better during the other study peak hours. Signal warrants are met at this intersection as described in

Section 7.2 and a new signal is recommended as mitigation at this location. Potential improvements at this intersection are discussed in greater detail in the following section of this report.

27. **NYS Route 32/Old Route 32/CR 34**: The turning movements at this unsignalized intersection currently operate at LOS B or better during the study peak hours. Under the No-Build and SP, RWCS, and AOR Build conditions, this intersection's turning movements will operate generally similar to the current condition with minimal increases in delay.

28. **Harry Wells Road/Buffalo Road**: The turning movements at this unsignalized intersection currently operate at LOS A during all study peak hours. Under the No-Build and throughout the SP, RWCS, and AOR Build conditions, all movements will operate at LOS B or better.

7.7 Queueing Analysis Results

A queuing assessment was performed at each signalized intersection during all peak hours under existing, background, SP full build, and SP full build with mitigation conditions to determine the 95th percentile queue length, measured from the stop bar location for each approach using Synchro. The existing 95th percentile queues are shown in Figures 3D-3F, the background 95th percentile queues are shown in Figures 4D-4F, the SP full build 95th percentile queues are shown in Figures 7J-7K, and the SP full build 95th percentile queues are shown in Figures 7M-7O and discussed below.

3. **NYS Route 212/Proposed Site Driveway**: None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection with the recommended traffic signal installed at this intersection, therefore, there is ample storage capacity at this intersection.

4. **NYS Route 212/NYS Route 32/Speedway Driveway:** None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under all conditions, therefore, there is ample storage capacity at this approach. It should be noted that the 95th percentile southbound queue is 866 feet under SP full build conditions during the weekday PM and Saturday peak hours. With the recommended mitigation in place at this intersection, the 95th percentile queue is reduced to 562 feet during the PM peak hour and 573 feet during the Saturday peak hour.

9. **NYS Route 212/I-87 Northbound Ramp/McDonalds Driveway:** None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under existing or background conditions. Under the SP full build conditions, the northbound thru/right approach 95th percentile queue exceeds the 215 feet of available storage during the weekday PM, Friday, and Saturday peak hours. Under the SP full build with mitigation condition, the northbound right 95th percentile queues do not exceed the 215 feet of available storage under any peak hour. However, the 95th percentile queue for the northbound left/thru approach is anticipated to exceed the 215 feet of available storage during the weekday PM, Friday, and Saturday peak hours. To mitigate the northbound left/thru 95th percentile queue, it is recommended that the northbound left/thru storage lane is extended to provide 450 feet of storage. With the recommended mitigation in place, the 95th percentile queue for the westbound thru/right approach is anticipated to extend into the adjacent Kings Highway intersection during the weekday PM and Friday peak hours. Given the uncertainty of the site program, the long timeframe for the project build-out, that there may be improvements to the intersection between now and when the project is built, and that this long queue may only occur a few times during the peak hours, no additional mitigation is recommended at this intersection.

14. **NYS Route 212/Kings Highway/Buns Burger Driveway:** None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under existing or background conditions. Under the SP full build conditions, the eastbound thru approach 95th percentile queue extends into the adjacent I-87 NB Ramps intersection during the Saturday and Sunday peak hours. Under the SP full build with mitigation condition, the eastbound thru approach 95th percentile queue still extends into the adjacent I-87 NB Ramps intersection during the Saturday and Sunday peak hours. Given the uncertainty of the site program, the long timeframe for the project build-out, that there may be improvements to the intersection between now and when the project is built, and that this long queue may only occur a few times during the peak hours, no additional mitigation is recommended at this intersection.

16. **NYS Route 212/Big Lots Driveway:** None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under all conditions at this intersection, therefore, there is ample storage capacity at this intersection.

18. **NYS Route 32/Market Street**: None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under all conditions at this intersection, therefore, there is ample storage capacity at this intersection.

19. **NYS Route 32/Main Street/Market Street:** None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under all conditions at this intersection, therefore, there is ample storage capacity at this intersection.

20. **Main Street/Partition Street**: None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under all conditions at this intersection, therefore, there is ample storage capacity at this intersection.

21. **NYS Route 32/I-87 Southbound Ramp/Augusta Savage Road (Site Driveway):** None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection during any peak hour under existing conditions. Under the background, SP full build, and SP full build with mitigation conditions, the southbound left approach 95th percentile queue does exceed the 350 feet of available storage during the Sunday peak hour. Under the SP full build condition, the northbound left 95th percentile queue does exceed the 145 feet of available storage under weekday PM, Friday, Saturday, and Sunday peak hours. Under the SP full build with mitigation condition, the northbound left 95th percentile queue does exceed the 145 feet of available storage under weekday PM, Friday, and Saturday peak hours. To mitigate the northbound left queue, it is recommended that the northbound left turn lane is extended to provide 250 feet of storage. Given the uncertainty of the site program, the long timeframe for the project build-out, that this long queue may only occur a few times during the peak hours, and that the southbound left queue is driven by ski traffic going onto the I-87 SB highway which only occurs during a portion of the year, no additional mitigation is recommended at this intersection.

23. **NYS Route 32/NEA Driveway:** None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection with the recommended traffic signal installed at this intersection with the exception of the northbound left 95th percentile queues which exceed the 150 feet of available storage, therefore, it is recommended that the northbound left turn lane is constructed with 250 feet of storage such that there is ample storage capacity at this intersection.

25. **NYS Route 32/Peoples Road/Hommelville Road**: None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection with the recommended traffic signal installed at this intersection, therefore, there is ample storage capacity at this intersection.

26. **NYS Route 32/CR 34 (Old Kings Highway)**: None of the 95th percentile queues exceed the available storage or extend into an adjacent signalized intersection with the recommended traffic signal installed at this intersection, therefore, there is ample storage capacity at this intersection.

7.8 Off-Site Mitigation

The capacity and queueing analyses reveal that off-site locations are expected to experience operational constraints due to the additional volumes from full build-out in the PDD. Possible improvements have been identified that, if implemented, will improve the operations at these locations. **Table 12** provides a summary of the locations with these constraints and the possible improvements. If approved, these improvements would be implemented by the applicant in coordination with the Town of Saugerties, Ulster County, and NYSDOT and would be funded based on the respective jurisdictional agency's preferred method. Conceptual improvement plans would be prepared subsequent to preliminary approval by the respective jurisdictional agencies.

Table 12: *Off-Site Mitigation Summary*

Location	Build Conditions Concerns	Possible Improvements
NYS Route 32/NYS Route 212 Intersection	• Southbound delays • Overall intersection delays • Westbound and southbound queues	• Signal timing modifications • Southbound approach lane geometry changes
NYS Route 212/I-87 NB Ramp Intersection/ McDonalds Driveway	• Overall intersection delay • Eastbound delays • Queue on the corridor	• Construct northbound right lane • Extend second northbound lane to provide 450 ft of storage • Signal phasing/timing/coordination modifications
NYS Route 212 Signalized Intersections: 3. Kings Highway 4. Big Lots Driveway	• Overall intersection delay • Eastbound delays • Queue on the corridor	• Signal timing coordination
NYS Route 212/I-87 SB Ramp Intersection/ Augusta Savage Rd	• Overall intersection/approach delays • Queue on the approaches	• Construct additional approach lanes and/or revise lane geometry on all four approaches • Signal phasing/timing modifications
NYS Route 32/Hommelville Rd/Peoples Rd	• Delays on eastbound and westbound approaches	• Proposed traffic signal
NYS Route 32/Old Kings Highway (CR 34)	• Delays on westbound approach	• Install northbound right turn lane • Proposed traffic signal

As stated above, this analysis and the recommended mitigation is based on a full build-out plan in the PDD to inform decision makers of the potential areas of concern. It is anticipated that each application that is made to the Town of Saugerties for development within the PDD will be accompanied with trip generation information that can be compared to this TIS to identify the need and timing for implementing the recommend improvements.

7.9 Construction Traffic

In this preliminary phase, the composition of construction related truck traffic associated with the construction of the development is still being determined. In preparation for the anticipated construction related truck traffic, the routes depicted in the figure on the right to access the site have been identified.

As shown, construction related trucks bound to/from the site would travel on I-87. It should be noted that I-87 is a designated Qualifying Highway per the NYSDOT *Truck Book*, dated October 2022. This designation allows for Special Dimension Vehicles (SDVs) to utilize the roadway. It is noted that SDVs are permitted to travel on surrounding roadways to I-87 up to one (1) mile from the site per the NYSDOT *Truck Book*. Any existing truck restrictions will be considered when planning routes for any oversized deliveries to the site.

7.10 Other Considerations

Within the DEIS Scoping Document, there are several items listed under section 4.6.8. "Impacts on Transportation" that do not fit under the previous parts of this report. As such, they are discussed below.

The goals of the Ulster County Transportation Improvement Program were reviewed. The following items are noted:

- The project would include a large area of open space and the conservation of the Beaverkill stream which is protecting and enhancing the environment. The suggested improvements will not affect the Beaverkill.
- This project is expected to improve the quality of life and economic vitality of the area and enhance travel and tourism. The suggested improvements, once implemented, will minimize recognizable delays in the transportation system.
- The improvements discussed in Table 12, specifically for the Peoples Road/Hommelville and NYS Route 32/Old Kings Highway (CR 34) intersections, would improve the safety of the transportation system for motorized users.

The project layout would be designed to provide adequate internal access and circulation throughout the site. It is noted that at this preliminary stage, details of the internal access roadways and circulation patterns, and other operational characteristics have not been finalized. As such, turning templates have not been prepared. These design evaluations will be conducted during the Town's review of a site plan application for a proposed development within the PDD. Internal pedestrian and bicycle accommodations will also be provided on-site but have not been finalized at this time. As the project advances, coordination with emergency services organizations including police, fire, and ambulance will be made to ensure their requirements are met, including truck turning movements.

As part of this project, consideration will be made to expand the existing UCAT bus service shown in Table 3 to serve the existing park and ride facility located along the NYS Route 32 site frontage. It is noted that the park and ride facility permits carpool parking for up to 72 hours; however, the existing parking demand was not evaluated at this time. As this project is advanced, the applicant is willing to work with the Town of Saugerties and other relevant agencies to accommodate and promote this park and ride facility and implement pedestrian and parking improvements, as needed. It should be noted that if/when the park and ride improvements and bus route changes are implemented, it is expected

that a portion of the site-generated trips will be made via bus transit, thus reducing the number of primary vehicular trips at the site driveways and study intersections. However, for the purpose of this report, no transit trip reductions were applied.

8.0 CONCLUSIONS AND RECOMMENDATIONS

This report identified and evaluated the potential traffic impacts that can be expected from the proposed rezoning of the Winston Farm development. The scope of this study was based on Section 4.6.8 "Impacts on Transportation" of the Final Scope DGEIS, dated January 4, 2023 and includes 26 off-site intersections. Traffic volume data was collected in December 2022 and January 2023 in order to capture peak ski season traffic and the study conservatively evaluated a design year of 2040. The study evaluated three development scenarios – As-of-Right (AOR), Sponsor's Preferred (SP), and Reasonable Worst Case Scenario (RWCS). The results of this comprehensive study determined that the existing transportation network can adequately accommodate the projected traffic volumes and resulting minor traffic impacts to study area intersections with the recommended mitigation in place. The following sets forth the conclusions and recommendations based upon the results of the analyses:

Conclusions

1. The crash analysis indicates that nine (9) of the twenty-six (26) intersections evaluated experienced crash rates greater than the state-wide average for similar types of intersections. The crash analysis generally did not identify any geometric deficiencies at any of the intersections.
2. All site driveways will be signalized thereby eliminating most sight distance concerns. As each phase of the project goes through the site planning process and updated traffic studies are provided, they should look closely at the access points at that time to determine if right turn on red movements should be prohibited due to sight distance concerns.
3. At this preliminary phase of the project, the exact number and layout of parking areas has not been determined. However, upon review of the plans it is evident that ample parking areas are strategically provided throughout the site area to serve the individual land uses on-site.
4. Under the AOR scenario, the project would generate the fewest amount of peak hour trips. Under the SP scenario, the project would generate more trips than under AOR scenario during each of the study peak hours with the lowest difference being 371 total trips and the greatest difference being 662 total trips. Finally, under the RWCS scenario, the project would generate more trips than under both the AOR and SP scenarios during each of the study peak hours.
5. The AOR scenario is expected to generate approximately 327 entering/494 exiting vehicle trips during the AM peak hour, 592 entering/431 exiting vehicle trips during the PM peak hour, 671 entering/450 exiting vehicle trips during the Friday peak hour, 668 entering/714 exiting vehicle trips during the Saturday peak hour, and 521 entering/495 exiting vehicle trips during the Sunday peak hour.
6. The SP scenario is expected to generate approximately 645 entering/583 exiting vehicle trips during the AM peak hour, 810 entering/781 exiting vehicle trips during the PM peak hour, 926 entering/856 exiting vehicle trips during the Friday peak hour, 933 entering/856 exiting vehicle trips during the Saturday peak hour, and 681 entering/706 exiting vehicle trips during the Sunday peak hour.
7. The RWCS scenario is expected to generate approximately 754 entering/642 exiting vehicle trips during the AM peak hour, 873 entering/853 exiting vehicle trips during the PM peak hour, 952 entering/881 exiting vehicle trips during the Friday peak hour, 999 entering/915 exiting vehicle trips during the Saturday peak hour, and 775 entering/803 exiting vehicle trips during the Sunday peak hour.
8. The left turn lane warrant investigation indicates that a left-turn treatment is warranted at the NYS Route 212/proposed easterly driveway and at the NYS Route 32/Proposed driveway intersections during all peak hours

under full development conditions. A left-turn treatment is not warranted at the NYS Route 212/proposed westerly driveway.

9. Based upon the results of the traffic signal warrant analysis, a traffic signal is warranted at all four intersections evaluated under full build conditions. These locations include: the existing NY-32/Peoples Rd/Hommelville Rd and NY-32/Old Kings Hwy intersections and the NYS Route 212/Proposed Easterly Driveway and NYS Route 32/Proposed Driveway intersections.
10. The intersections that meet signal warrants were also evaluated for feasibility of installing a roundabout. All intersections are likely to operate sufficiently as either a single-lane or double-lane roundabout depending on the intersection ADT. It should be noted that the geometric feasibility, i.e. the constructability of a roundabout, was not investigated at this time. For the purposes of this study, detailed operational analyses of these intersections were not conducted. Rather, capacity improvements and/or phasing and timing changes were explored to mitigate operational constraints expected under the 2040 Sponsors Preferred Build conditions. A more detailed evaluation should be conducted as traffic studies are updated during the site plan approval processes in the future.
11. A feasibility evaluation for roundabouts was performed at the following intersections: NYS Route 32/Old kings Hwy, NYS Route 32/Peoples Road, NYS Route 32/Northeast Area Driveway, NYS Route 32/Augusta Savage Road/Interstate-87 SB Ramp, NYS Route 32/NYS Route 212, and NYS Route 212/South Area Driveway. all intersections are likely to operate sufficiently as either a single-lane or double-lane roundabout depending on the intersection ADT.
12. Most of the study intersections are expected to operate at acceptable operating conditions that are similar to the background (No-build) conditions with the recommended mitigation in place. Section 7.6 provides details related to the operating conditions at each intersection.
13. A queuing assessment was performed at each signalized intersection during all peak hours under existing, background, SP full build, and SP full build with mitigation conditions to determine the 95th percentile queue length, measured from the stop bar location for each approach using Synchro. In general, 95th percentile queues so not exceed available storage with the recommended mitigation measures in place with minor exceptions that are discussed in more detail in Section 7.7.
14. The proposed project intends to embrace the goals of Ulster County Transportation Improvement Program. Furthermore, it is prepared to work with UCAT as well as the Greyhound and Trailways bus services to expand services to better support the traveling public.
15. Pursuant to the State Environmental Quality Review Act, this detailed analysis demonstrates that the proposed project does not result in any significant adverse traffic impacts.

Recommendations

1. Based on the crash evaluation, it is recommended that NYSDOT considers installing flashing yellow arrows for the permitted left turn phases for at least the eastbound approach at the NYS Route 212/NYS Route 32 intersection to mitigate the left turn crash pattern.
2. As the proposed development moves through the future site plan review process, detailed design related to the number of parking spaces, appropriate on and off-site wayfinding, and the need for temporary event traffic control should be evaluated.
3. A more detailed roundabout evaluation should be conducted as traffic studies are updated during the site plan approval processes in the future.
4. The detailed capacity analysis showed that the additional traffic volumes generated by the proposed project can be accommodated by the existing roadway network with the recommended mitigation in place.

5. Various mitigation measures were evaluated to address operational constraints resulting from the SP and RWCS development scenarios. These mitigation measures are discussed in detail in Sections 7.6 and 7.8 and can be found in Table 12 which is reproduced below. The mitigation measures include changes to intersection geometry, signalization of intersections, and adjustments to existing signal timings and phasing.

Off Site Mitigation Summary

Location	Build Conditions Concerns	Possible Improvements
NYS Route 32/NYS Route 212 Intersection	• Southbound delays • Overall intersection delays • Westbound and southbound queues	• Signal timing modifications • Southbound approach lane geometry changes
NYS Route 212/I-87 NB Ramp Intersection/ McDonalds Driveway	• Overall intersection delay • Eastbound delays • Queue on the corridor	• Construct northbound right lane • Extend second northbound lane to provide 450 ft of storage • Signal phasing/timing/coordination modifications
NYS Route 212 Signalized Intersections: 5. Kings Highway 6. Big Lots Driveway	• Overall intersection delay • Eastbound delays • Queue on the corridor	• Signal timing coordination
NYS Route 212/I-87 SB Ramp Intersection/ Augusta Savage Rd	• Overall intersection/approach delays • Queue on the approaches	• Construct additional approach lanes and/or revise lane geometry on all four approaches • Signal phasing/timing modifications
NYS Route 32/Hommelville Rd/Peoples Rd	• Delays on eastbound and westbound approaches	• Proposed traffic signal
NYS Route 32/Old Kings Highway (CR 34)	• Delays on westbound approach	• Install northbound right turn lane • Proposed traffic signal

Explanation for extra leg 1 movements

Movements entering the extra leg

NT2	Movements coming from NB on Market St entering into the Extra Leg 1 (Smokers Choice Dwy)
SU2	Movements coming from SB on Market St entering into the Extra Leg 1 (Smokers Choice Dwy)
EL2	Movements coming from EB on Ulster Ave entering into the Extra Leg 1 (Smokers Choice Dwy)

Movements exiting the extra leg

S2U2	Movements exiting from Extra Leg 1 (Smokers Choice Dwy) entering into Market St heading NB
S2T2	Movements exiting from Extra Leg 1 (Smokers Choice Dwy) entering into Market St heading SB
S2R2	Movements exiting from Extra Leg 1 (Smokers Choice Dwy) entering into Ulster Ave heading WB

Explanations for extra leg movements

Movements entering the extra leg
SL2 Movements coming from NB on Harry Wells Rd Dwy entering into the extra leg (8 Buffalo Rd)

Movements exiting the extra leg
W2R2 Movements exiting from extra leg (8 Buffalo Rd) entering into Harry Wells Rd heading NB

Explanations for extra leg movements

Movements entering the extra leg

EL2	Movements coming from EB on Ulster Ave entering into he extra leg (Stewardst's Shop Dwy)
WR2	Movements coming from WB on Ulster Ave entering into he extra leg (Stewardst's Shop Dwy)

Movements exiting the extra leg

S2R2	Movements exiting from extra leg (Stewart's Shop Dwy) entering into Ulster Ave heading WB

Explanations for extra leg movements

Movements entering the extra leg

NT2	Movements coming from NB on Market St entering into the extra leg (Smoker Choice Dwy)
SU2	Movements coming from SB on Market St entering into the extra leg (Smoker Choice Dwy)
EL2	Movements coming from EB on Ulster Ave entering into the extra leg (Smoker Choice Dwy)

Movements exiting the extra leg

S2T2	Movements exiting from extra leg (Smoker Choice Dwy) entering into Market St heading SB
S2U2	Movements exiting from extra leg (Smoker Choice Dwy) entering into Market St heading NB
S2R2	Movements exiting from extra leg (Smoker Choice Dwy) entering into Ulster Ave heading WB

Explanations for extra leg movements

Movements entering the extra leg

EL2 Movements coming from EB on Ulster Ave entering into he extra leg (Stewardst's Shop Dwy)
WR2 Movements coming from WB on Ulster Ave entering into he extra leg (Stewardst's Shop Dwy)

Movements exiting the extra leg

S2R2 Movements exiting from extra leg (Stewart's Shop Dwy) entering into Ulster Ave heading WB

Explanation for extra leg 1 movements

Movements entering the extra leg

NT2	Movements coming from NB on Market St entering into the Extra Leg 1 (Smokers Choice Dwy)
SU2	Movements coming from SB on Market St entering into the Extra Leg 1 (Smokers Choice Dwy)
EL2	Movements coming from EB on Ulster Ave entering into the Extra Leg 1 (Smokers Choice Dwy)

Movements exiting the extra leg

S2U2	Movements exiting from Extra Leg 1 (Smokers Choice Dwy) entering into Market St heading NB
S2T2	Movements exiting from Extra Leg 1 (Smokers Choice Dwy) entering into Market St heading SB
S2R2	Movements exiting from Extra Leg 1 (Smokers Choice Dwy) entering into Ulster Ave heading WB

Explanation for extra leg movements

Movements entering the extra leg
EL2 Movements coming from EB on Rte 212/Ulster Ave entering into the Extra Leg (Stewart's Shops Dwy)
WR2 Movements coming from WB on Rte 212/Ulster Ave entering into the Extra Leg (Stewart's Shops Dwy)

Movements exiting the extra leg
S2R2 Movements exiting from Extra Leg (Stewart's Shops Dwy) entering into Rte 212/Ulster Ave heading WB

Explanation for extra leg movements

Movements entering the extra leg

NT2	Movements coming from NB on Market St entering into the Extra Leg (Smokers Choice Dwy)
EL2	Movements coming from EB on Ulster Ave entering into the Extra Leg (Smokers Choice Dwy)
SU2	Movements coming from SB on Market St entering into the Extra Leg (Smokers Choice Dwy)

Movements exiting the extra leg

S2T2	Movements exiting from Extra Leg (Smokers Choice Dwy) entering into Market St heading SB
S2R2	Movements exiting from Extra Leg (Smokers Choice Dwy) entering into Ulster Ave heading WB
S2U2	Movements exiting from Extra Leg (Smokers Choice Dwy) entering into Market St heading NB

Subject: Re: Background Information for Proposed Development in Saugerties

EXTERNAL

The majority of the proposed or approved development that is currently before the Planning Board is located more towards the south side of Saugerties within the Glasco area. Those projects include:

Wyldwyck - 72 unit facility made up of an inn and cabins - Liberty Street Extension - Approved 2007
The Summit - 160-unit residential complex - 260 Glasco Turnpike/Rt. 9W - Approved 2022
The Villa Residences - 80-unit mixed use residential complex - Spaulding Lane - Pending
Stone Creek Commons - 50-unit mixed use housing complex - 3190 Route 9W - Pending
Pond View Apartments - 24-unit apartment complex - 14 Stevens Drive - Pending

Caution! This message was sent from outside your organization.

Hi Becky,

We are putting together a traffic impact study for a proposed development in the Town of Saugerties. In order to complete this we need to know if there are any projects in the area that are currently in

construction or are approved for construction that will affect our area of study. The proposed location is to the west of NY-32, and to the north of NY-212. See snip below for a snip of google maps of where the project will be located drawn in red. If there are any projects that are currently in construction or have been approved for construction which impact traffic on NY-32, NY-212 or any roadway in the Town, could you send us any information that you have on them, so we can account for them in our study?

Thanks,

Nick Merrifield, EIT

Junior Traffic Engineer

Scenario - 5

Scenario Name: Sunday Peak
User Group:
Dev. phase: 1
No. of Years to Project Traffic: 0
Analyst Note:

Warning: The time periods among the land uses do not appear to match.

VEHICLE TRIPS BEFORE REDUCTION

Land Use & Data Source	Location	IV	Size	Time Period	Method / Rate/Equation	Entry / Split%	Exit / Split%	Total
110 - General Light Industrial	General Urban/Suburban	1000 Sq. Ft. GFA	250	Sunday, Peak Hour of Generator	Average	83	90	173
Data Source: Trip Generation Manual, 11th Ed					0.69	48%	52%	
820 - Shopping Center (>150k)	General Urban/Suburban	1000 Sq. Ft. GLA	349.8	Sunday, Peak Hour of Generator	Average	403	419	822
Data Source: Trip Generation Manual, 11th Ed					2.35	49%	51%	
210 - Single-Family Detached Housing	General Urban/Suburban	Dwelling Units	154	Sunday, Peak Hour of Generator	Best Fit (LIN)	68	60	128
Data Source: Trip Generation Manual, 11th Ed					T = 0.80(X) + 4.76	53%	47%	
215 - Single-Family Attached Housing	General Urban/Suburban	Dwelling Units	110	Sunday, Peak Hour of Generator	Best Fit (LIN)	46	46	92
Data Source: Trip Generation Manual, 11th Ed					T = 1.18(X) - 38.18	50%	50%	
220 - Multifamily Housing (Low-Rise) - Not	General Urban/Suburban	Dwelling Units	650	Sunday, Peak Hour of Generator	Average	117	117	234
Data Source: Trip Generation Manual, 11th Ed					0.36	50%	50%	
310 - Hotel	General Urban/Suburban	Rooms	150	Sunday, Peak Hour of Generator	Average	41	44	85
Data Source: Trip Generation Manual, 11th Ed					0.57	48%	52%	
416 - Campground/Recreational Vehicle Park	General Urban/Suburban	Occupied Campsites	100	Weekday, PM Peak Hour of Generator	Average	25	16	41
Data Source: Trip Generation Manual, 11th Ed					0.41	62%	38%	

VEHICLE TO PERSON TRIP CONVERSION

BASELINE SITE VEHICLE CHARACTERISTICS:

Land Use	Baseline Site Vehicle Mode Share		Baseline Site Vehicle Occupancy		Baseline Site Vehicle Directional Split	
	Entry (%)	Exit (%)	Entry	Exit	Entry (%)	Exit (%)
110 - General Light Industrial	100	100	1.3	1.3	48	52
820 - Shopping Center (	150k)	100	100	1	1	49
210 - Single-Family Detached Housing	100	100	1	1	53	47
215 - Single-Family Attached Housing	100	100	1	1	50	50
220 - Multifamily Housing (Low-Rise) - Not Close to Rail Transit	100	100	1	1	50	50
310 - Hotel	100	100	1	1	48	52
416 - Campground/Recreational Vehicle Park	100	100	1	1	62	38

ESTIMATED BASELINE SITE PERSON TRIPS:

Land Use	Person Trips by Vehicle		Person Trips by Other Modes		Total Baseline Site Person Trips	
	Entry	Exit	Entry	Exit	Entry	Exit
110 - General Light Industrial	108	117	0	0	108	117
	225		0		225	
820 - Shopping Center (	150k)	403	419	0	0	403
	822		0		822	
210 - Single-Family Detached Housing	68	60	0	0	68	60
	128		0		128	
215 - Single-Family Attached Housing	46	46	0	0	46	46
	92		0		92	
220 - Multifamily Housing (Low-Rise) - Not Close to Rail Transit	117	117	0	0	117	117
	234		0		234	
310 - Hotel	41	44	0	0	41	44
	85		0		85	
416 - Campground/Recreational Vehicle Park	25	16	0	0	25	16
	41		0		41	

NEW VEHICLE TRIPS

Land Use	New Vehicle Trips		
	Entry	Exit	Total
110 - General Light Industrial	83	90	173
820 - Shopping Center (	150k)	403	419
210 - Single-Family Detached Housing	68	60	128
215 - Single-Family Attached Housing	46	46	92
220 - Multifamily Housing (Low-Rise) - Not Close to Rail Transit	117	117	234
310 - Hotel	41	44	85
416 - Campground/Recreational Vehicle Park	25	16	41

RESULTS

Intersection Crash Rate Calculations

Winston Farm

Intersection #1: NY-212 at Blue Mountain Rd
Date of Count: Tuesday, January 24, 2023

Number of Crashes: 10
Number of Injuries: 0
Number of Fatalities: 0
Entering Vehicles (PM): 666
ADT: 7011
Start Date: October 1, 2019
End Date: September 30, 2024
Number of Years: 5

Intersection Type: 3 Legged
Area Type: Urban
Control Type: Sign 1-3 Lanes

crash rate = Number of Crashes x 1 Million / ADT x 365 Days per Year x Number of Years

crash rate = 10 x 1,000,000 / 7011 x 365 x 5

	Crash Rate		Fatality Rate	Injury Rate
Study Intersection	**0.78**	**cr/mve**	**0%**	**0%**
Statewide Average*	**0.19**	**cr/mve**		

ADT = Average Daily Total vehicles entering intersection
cr/mve = crashes per million entering vehicles
* Most recent available 2019 Average Crash Rates for State Highways by Facility Type

Intersection Crash Rate Calculations

Winston Farm

Intersection #28 Harry Wells Rd at Buffalo Rd
Date of Count: Tuesday, January 24, 2023

Number of Crashes: 0
Number of Injuries: 0
Number of Fatalities: 0
Entering Vehicles (AM): 149
ADT: 1568
Start Date: October 1, 2019
End Date: September 30, 2024
Number of Years: 5

Intersection Type: 3 Legged
Area Type: Urban
Control Type: Sign 1-3 Lanes

crash rate = Number of Crashes x 1 Million / ADT x 365 Days per Year x Number of Years

crash rate = 0 x 1,000,000 / 1568 x 365 x 5

	Crash Rate		Fatality Rate	Injury Rate
Study Intersection	**0.00**	**cr/mve**	**#DIV/0!**	**#DIV/0!**
Statewide Average*	**0.19**	**cr/mve**		

ADT = Average Daily Total vehicles entering intersection
cr/mve = crashes per million entering vehicles
* Most recent available 2019 Average Crash Rates for State Highways by Facility Type

ITEMS: 203.02, 304.11000008, 608.0101
REMOVE EXISTING BLUESTONE AND REPLACE WITH NEW CONCRETE SIDEWALK

ITEMS: 304.11000008, 608.40010001
REMOVE STORE AND RESET EXISTING WALK (STONE DUST SETTING BED)

ITEMS: 203.02, 608.40020008
REMOVE EXISTING BLUESTONE AND REPLACE WITH NEW BLUESTONE
(STONE DUST SETTING BED)

GRID NORTH

NOTES:

1. SIDEWALK WORK TO BE PERFORMED UNDER THE FOLLOWING ITEMS: 203.02, 304.11000008, 520.50140008, 608.0101, 608.01030008, 608.21000003, 608.40010001, 608.40020008, 609.0401 AND 609.06010008. NEW SIDEWALK MUST MATCH ELEVATION AND GRADE OF EXISTING BLUESTONE SLABS.
2. THE EXISTING BLUESTONE SIDEWALK NOT TO BE RESET BUT IN CONFLICT WITH THE NEW WORK ON THE SOUTHEAST QUADRANT SHALL BE CAREFULLY REMOVED AND MADE AVAILABLE TO THE VILLAGE. THE CONTRACTOR SHALL REMOVE THE BLUESTONE AND STORE IT IN A LOCATION ACCEPTABLE TO THE VILLAGE. IF THE VILLAGE DOES NOT WISH TO ACCEPT IT, THE BLUESTONE WILL BECOME THE PROPERTY OF THE CONTRACTOR. THE ENGINEER IN CHARGE SHALL COORDINATE THIS ACTIVITY. THERE WILL BE NO SEPARATE PAYMENT FOR THIS WORK.
3. THE TRAFFIC SIGNAL POLES, PEDESTRIAN POLES, PEDESTRIAN HOUSINGS, BRACKETS AND PUSH BUTTON HARDWARE, CONTROLLER CABINET, CABINET BASE, METER PAN, SERVICE ENTRANCE, DISCONNECT SWITCH, PIPE NIPPLES AND ELBOWS, BOLT COVERS, AND ALL CONNECTION HARDWARE (BANDS, CLAMPS, BRACKETS, PIPE STRAPS, NUTS AND BOLTS, ETC.) SHALL BE PAINTED BLACK TO MATCH FEDERAL COLOR STANDARD NUMBER 37030. THE COST OF SHOP PAINTING THE TRAFFIC SIGNAL POLES AND PEDESTRIAN POLES SHALL BE INCLUDED IN THE UNIT PRICE FOR ITEM 657.18020010. THE COST OF SHOP PAINTING ALL OTHER EQUIPMENT AND COMPONENTS SHALL BE INCLUDED IN THE UNIT PRICE FOR ITEM 680.06040110.
4. ALL POLE FOUNDATIONS MUST BE FLUSH WITH THE SIDEWALK WHEREVER POSSIBLE.
5. ITEM 604.07 SHALL INCLUDE THE REMOVAL OF CURB BOXES FROM THE CATCH BASINS. THE COST TO FURNISH AND INSTALL THE STEEL PLATE SHALL BE INCLUDED IN THE UNIT PRICE FOR ITEM 604.07. THE COST TO FURNISH AND INSTALL THE TAPERED CURB SECTION SHALL BE INCLUDED IN ITEM 609.0401.
6. THE CONTRACTOR SHALL CAREFULLY REMOVE THE EXISTING ORNAMENTAL SIGN BASE ON THE SOUTHWEST CORNER OF THE INTERSECTION AND RELOCATE IT TO THE SOUTHEAST CORNER OF THE INTERSECTION. THE COST OF THIS WORK SHALL BE PAID FOR UNDER ITEM: 647.31 RELOCATE SIGN PANEL, SIGN PANEL ASSEMBLY SIZE 1 (UNDER 2.8 SQUARE METERS) (UNDER 30 SQUARE FEET).
7. THE EXISTING VILLAGE DESTINATION SIGN CURRENTLY ATTACHED TO THE TRAFFIC SIGNAL POLE ON THE NORTHWEST QUADRANT SHALL BE REMOVED AND MADE AVAILABLE TO THE VILLAGE OF SAUGERTIES. THE CONTRACTOR SHALL CAREFULLY REMOVE THE SIGN AND STORE IT IN A LOCATION ACCEPTABLE TO THE VILLAGE. THE ENGINEER IN CHARGE SHALL COORDINATE THIS ACTIVITY. THIS WORK SHALL BE PAID UNDER ITEM 647.41.
8. THE EXISTING VILLIAGE OWNED AND OPERATED CCTV EQUIPMENT INCLUDING BUT NOT LIMITED TO A DOME CAMERA, CAMERA CONTROLLER CABINET, WIRELESS RADIOS AND ANTENNA, AND ASSOCIATED CABLES AND WIRING SHALL BE REMOVED FROM THE EXISTING SIGNAL POLE ON THE NORTHWEST QUADRANT OF THE INTERSECTION BY THE VILLAGE OF SAUGERTIES. THE ENGINEER IN CHARGE SHALL CONTACT THE VILLAGE 4 WEEKS BEFORE THE SIGNAL WORK IS TO BEGIN TO FACILITATE THE REMOVAL OF THE CAMERA SYSTEM AND APPURTENANCES.
9. ALL WORK SHALL BE PERFORMED WITHIN THE EXISTING R.O.W. LIMITS. THE CONTRACTOR SHALL VERIFY THE R.O.W. LIMITS WITH THE ENGINEER IN CHARGE.
10. ALL ANCHOR BOLTS SHALL BE GRADE 55.
11. ALL MAST ARMS AND PEDESTRIAN POLES SHALL BE INSTALLED WITH A MINIMUM CLEARANCE OF 4 FEET BETWEEN THE EDGE OF THE FOUNDATION AND THE OUTERMOST SURFACE OF THE BUILDINGS.
12. THE 6 FT X 9.5 FT BLUESTONE SLAB ON THE SOUTHWEST QUADRANT LOCATED DIRECTLY IN FRONT OF THE TANGO CAFE SHALL NOT BE DISTURBED FOR ANY REASON. NO MACHINERY OR HEAVY OBJECTS SHALL BE PLACED ON THIS SLAB AT ANY TIME.
13. THE COMBINED STRESS RATIO SHALL BE A MAXIMUM OF 0.90 FOR EACH COMPONENT OF EACH TRAFFIC SIGNAL POLE, INCLUDING THE ANCHOR BOLTS.
14. THE COST OF TURF RESTORATION ADJACENT TO THE NEW CURB AREA ON THE N.E. QUADRANT SHALL BE INCLUDED IN THE BID PRICE FOR ITEM 609.0104.
15. ALL BOLLARDS SHALL BE POWDERCOATED BLACK TO MATCH FEDERAL COLOR STANDARD NUMBER 37030. THE COST OF POWDERCOATING SHALL BE INCLUDED IN THE UNIT PRICE FOR ITEM 608.73236108.

1. THE FOOTING MOMENT SHOWN IN THE TABLE OF POLES IS THE MINIMUM CALCULATED AND IS FOR ESTIMATION PURPOSES ONLY. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY, IN CONJUNCTION WITH THE POLE SUPPLIER / MANUFACTURER, TO DETERMINE THE MAST ARM POLE STRENGTH AND FOOTING MOMENT FOR THE LOADING AS SHOWN IN THE CONTRACT PLANS. THE FOOTING MOMENT SHALL BE VERIFIED AND BE DESIGNED TO MATCH THE ULTIMATE STRENGTH OF THE MAST ARM POLE DESIGN AND THE FOUNDATION SHALL BE CONSTRUCTED AS SPECIFIED ON STANDARD SHEET 680-1. MAXIMUM FOOTING WIDTH IS NOT TO EXCEED 3 FEET.
2. IT IS THE CONTRACTOR'S RESPONSIBILITY TO DETERMINE THE FINAL GROUND AND PAVEMENT ELEVATIONS AND VERIFY THAT THE CLEARANCE FROM THE PAVEMENT AT IT'S HIGHEST POINT ALONG THE MAST ARM TO THE BOTTOM OF THE SIGNAL HEAD IS A MINIMUM OF 16'-6" PRIOR TO ORDERING THE MAST ARM POLES.

U-12 (SIGNAL NO(S)) | ULSTER (COUNTY)

INTERSECTION ROUTE 32 AT ROUTE 212

☐ CITY ☒ VILLAGE ☐ TOWN OF SAUGERTIES

Department Order filed 6-6-95 as Section 2051.21 Subdivision (e)

Prior specifications hereby superseded ☐ None ☒ September 5, 1973

Purpose : REINSTALLATION OF TRAFFIC SIGNAL CONTRACT D257019.

These specifications will be effective upon the ☐ Installation ☒ Modification of the necessary traffic control device(s) required by and conforming to the State Manual of Uniform Traffic Control Devices

I. This Signal shall

A. Operate in accordance with the Table of Operations and / of Change intervals as shown on page(s) 2 as a :

- ☐ Pretimed Signal
- ☐ Semi-traffic actuated signal
- ☒ Full-traffic actuated signal
- ☐ Pedestrian actuated signal
- ☐ Other

B.
- ☒ Display vehicular indications
- ☐ Display pedestrian indications
- ☒ Be equipped with vehicle detectors
- ☐ Be equipped with Pedestrian pushbuttons

as shown in the ☒ schematic ☐ scaled drawing on page 2

Be equipped with ☐ pre-emption ☐ interconnection and / or coordination which are described as follows

FILE SHOP CABINET
